Introduction to Computational Data Science

Many important questions ("What's the best restaurant in town?", "Is this law good for citizens?", etc.) are answered with *data*.

Data Scientists try and answer these questions by writing *programs that ask questions about data*.

Data of all types can be organized into **Tables**.

- Every Table has a **header row** and some number of **data rows**.
- **Quantitative data** is numeric and measures *an amount*, such as a person's height, a score on a test, distance, etc. A list of quantitative data can be ordered from smallest to largest.
- **Categorical data** is data that specifies *qualities*, such as sex, eye color, country of origin, etc. Categorical data is not subject to the laws of arithmetic—for example, we cannot take the "average" of a list of colors.

Answering questions with data can take many forms. Here are a few types of questions, each requiring a different kind of analysis:

- **Lookup Questions** can be answered just by finding the right row and column of a table. (e.g., "How old is Toggle?")
- **Compute Questions** can be answered by computing over a single row or column. (e.g., "What is the average weight of animals from the shelter?")
- **Relate Questions** require looking for trends across multiple columns. (e.g., "Do cats tend to be adopted sooner than dogs?")

The Animals Dataset

name	species	sex	age	fixed	legs	pounds	weeks
Sasha	cat	female	1	false	4	6.5	3
Snuffles	rabbit	female	3	true	4	3.5	8
Mittens	cat	female	2	true	4	7.4	1
Sunflower	cat	female	5	true	4	8.1	6
Felix	cat	male	16	true	4	9.2	5
Sheba	cat	female	7	true	4	8.4	6
Billie	snail	hermaphrodite	0.5	false	0	0.1	3
Snowcone	cat	female	2	true	4	6.5	5
Wade	cat	male	1	false	4	3.2	1
Hercules	cat	male	3	false	4	13.4	2
Toggle	dog	female	3	true	4	48	1
Boo-boo	dog	male	11	true	4	123	24
Fritz	dog	male	4	true	4	92	3
Midnight	dog	female	5	false	4	112	4
Rex	dog	male	1	false	4	28.9	9
Gir	dog	male	8	false	4	88	5
Max	dog	male	3	false	4	52.8	8
Nori	dog	female	3	true	4	35.3	1
Mr. Peanutbutter	dog	male	10	false	4	161	6
Lucky	dog	male	3	true	3	45.4	9
Kujo	dog	male	8	false	4	172	30
Buddy	lizard	male	2	false	4	0.3	3
Gila	lizard	female	3	true	4	1.2	4
Bo	dog	male	8	true	4	76.1	10
Nibblet	rabbit	male	6	false	4	4.3	2
Snuggles	tarantula	female	2	false	8	0.1	1
Daisy	dog	female	5	true	4	68	8
Ada	dog	female	2	true	4	32	3
Miaulis	cat	male	7	false	4	8.8	4
Heathcliff	cat	male	1	true	4	2.1	2
Tinkles	cat	female	1	true	4	1.7	3
Maple	dog	female	3	true	4	51.6	4

Note: Hermaphrodite is the term for animals that carry eggs & produce sperm (nearly 1/3 of the non-insect animal species on the planet!). Plants that produce pollen & ovules are also hermaphrodites. Please do not use hermaphrodite to describe people.

Categorical or Quantitative?

For each piece of data below, circle whether it is **Categorical** or **Quantitative** data.

1 Hair color	CATEGORICAL quantitative
2 Age	categorical QUANTITATIVE
3 ZIP Code	CATEGORICAL quantitative
4 Date	CATEGORICAL quantitative
5 Height	categorical QUANTITATIVE
6 Sex	CATEGORICAL quantitative
7 Street Name	CATEGORICAL quantitative

For each question, circle whether it will be answered by **Categorical** or **Quantitative** data.

8 We'd like to find out the average price of cars in a lot.	categorical QUANTITATIVE
9 We'd like to find out the most popular color for cars.	CATEGORICAL quantitative
10 We'd like to find out which puppy is the youngest.	categorical QUANTITATIVE
11 We'd like to find out which cats have been fixed.	CATEGORICAL quantitative
12 We want to know which people have a ZIP code of 02907.	CATEGORICAL quantitative
13 We'd like to sort a list of phone numbers by area code.	categorical QUANTITATIVE

The Animals Dataset

What do you NOTICE about this dataset?	What do you WONDER about this dataset?	Question Type
Not every animal has the same number of legs	How many legs does Mittens have?	LOOKUP Compute Relate Can't answer
Some animals weigh more than others	How much does Mr. Peanutbutter weigh?	LOOKUP Compute Relate Can't answer
Some animals are older than others	Who is the oldest animal?	Lookup COMPUTE Relate Can't answer
Some animals take longer to get adopted	What is the average adoption time?	Lookup COMPUTE Relate Can't answer
Dogs seem to take longer than cats	Are dogs harder to get adopted?	Lookup Compute RELATE Can't answer
Lucky only has three legs	What happened to Lucky?	Lookup Compute Relate CAN'T ANSWER

1. This dataset is Animals from an animal shelter, which contains 31 data rows.

2. Some of the columns are:

a. species, which contains categorical data. Some example values are:
"cat" , "dog" , "lizard" , "rabbit" , "snail" and "tarantula".

b. age, which contains quantitative data. Some example values are:
1 , 5 , and 10.

What's on your mind?

Introduction to Programming in Pyret

Programming languages involve different *datatypes*, such as Numbers, Strings, and Booleans.

- Numbers are values like `1` , `0.4` , `1/3` , and `-8261.003` .
 - Numbers are *usually* used for quantitative data and other values are *usually* used as categorical data.
 - In Pyret, any decimal *must* start with a `0`. `0.22` is valid, but `.22` is not.
- Strings are values like `"Emma"` , `"Rosanna"` , `"Jen and Ed"` , or even `"08/28/1980"` .
 - In Pyret, all strings *must* be surrounded in quotation marks.
- Booleans are either `true` or `false` .

Operators (like `+` , `-` , `*` , `<` , etc.) work the same way in Pyret that they do in math.

- Operators are written between values, for example: `4 + 2` .
- In Pyret, operators must always have a space around them. `4 + 2` is valid, but `4+2` is not.
- If an expression has different operators, parentheses must be used to show order of operations. `4 + 2 + 6` and `4 + (2 * 6)` are valid, but `4 + 2 * 6` is not.

Applying Functions also works the way it does in math. The function name is first, followed by a list of arguments in parentheses.

- In math this could look like `f(5)` or `f(g(10, 4))` .
- In Pyret this could look like `star(50, "solid", "red")` .
- There are many other Pyret functions, for example `num-sqr` , `num-sqrt` `triangle` , `star` , `string-repeat` , etc.

Functions have contracts, which help explain how a function should be used. Every contract has three parts:

- The Name of the function - literally, what it's called.
- The Domain of the function - what *types of values* the function consumes, and in what order.
- The Range of the function - what *type of value* the function produces.

Value Definitions (like `x = 4` , or `y = 9 + 6`) also work the way they do in math. Every value definition starts with a name, followed by an equals sign, and then an expression. Once a value is defined, it can be referred to by name.

Numbers and Strings

Make sure you've loaded the code.pyret.org editor, and clicked "Run".

1. Try typing `42` into the Interactions Area and hitting "Enter". What happens?
2. Try typing in other Numbers. What happens if you try a decimal like `0.5`? A fraction like `1/3`? Try really big Numbers, and really small ones.
3. String values are always in quotes. Try typing your name (in quotes!). What happens when you hit Enter?
4. Try typing your name with the opening quote, but *without* the closing quote. What happens? Now try typing it without any quotes.
5. Is `42` the same as `"42"`? Why or why not? Write your answer below:

Operators

6. Just like math, Pyret has operators like `+`, `-`, `*` and `/`. Try typing in `4 + 2`, and then `4+2` (without the spaces). What can you conclude from this? Write your answer below:

(sample answer) Pyret needs spaces around operators

7. Type in the following expressions, one at a time: `4 + 2 + 6`, `4 + 2 * 6`, `4 + (2 * 6)`. What do you notice?
Write your answer below:

(sample answer) If we use multiple operators, we need parentheses

8. Try typing in `4 + "cat"`, and then `"dog" + "cat"`. What can you conclude from this? Write your answer below:

(sample answer) We can use `+` to add two numbers or two strings, but not a number and a string

Booleans

Boolean expressions are yes-or-no questions, and will always evaluate to either `true` ("yes") or `false` ("no"). What will each of the expressions below evaluate to? Write down the result in the blanks provided, and type them into Pyret if you're not sure.

1) <code>3 <= 4</code>	<u>true</u>	7) <code>"a" > "b"</code>	<u>false</u>
2) <code>3 == 2</code>	<u>false</u>	8) <code>"a" < "b"</code>	<u>true</u>
3) <code>2 < 4</code>	<u>true</u>	9) <code>"a" == "b"</code>	<u>false</u>
4) <code>3 <> 3</code>	<u>false</u>	10) <code>"a" <> "b"</code>	<u>true</u>
5) <code>5 >= 5</code>	<u>true</u>	11) <code>"a" <> "a"</code>	<u>false</u>
6) <code>4 >= 6</code>	<u>false</u>	12) <code>"a" == "a"</code>	<u>true</u>

13) In your own words, describe what `>` does.

It takes in two Numbers and returns true if the first is larger than the second OR It takes in two Strings and returns true if the first comes after the second in alphabetical order.

14) In your own words, describe what `<=` does.

It takes in two Numbers and returns true if the first is less than or equal to the second OR It takes in two Strings and returns true if the first precedes the second in alphabetical order.

15) In your own words, describe what `<>` does.

It takes in two numbers or string and returns true if they are not equal.

16) How many **Numbers** are there in the entire universe?

infinite

17) How many **Strings** are there in the entire universe?

infinite

18) How many **Images** are there in the entire universe?

infinite

19) How many **Booleans** are there in the entire universe?

two: true and false

Applying Functions

Type this line of code into the interactions area and hit "Enter": `triangle(50, "solid", "red")`

1	What is the name of this function?	triangle
2	What did the expression evaluate to?	(sample answer) a solid, red triangle
3	How many arguments does <code>triangle</code> expect?	3
4	What does the <code>triangle</code> function produce? (Numbers? Strings? Booleans?)	(sample answer) a picture? an image?

Catching Bugs

The following lines of code are all BUGGY! Can you spot the mistake? Match the code (left) with the mistake (right). If you have time, type in the buggy code and see what Pyret does!

- | | | |
|---|----------|--|
| <code>triangle(20, "solid" "red")</code> | 1
(C) | A Not enough arguments for triangle's Domain |
| <code>triangle(20, "solid")</code> | 2
(A) | B Missing open parentheses |
| <code>triangle(20, 10, "solid", "red")</code> | 3
(D) | C Missing a comma between arguments |
| <code>triangle (20, "solid", "red")</code> | 4
(E) | D Too many arguments for triangle's Domain |
| <code>triangle 20, "solid", "red")</code> | 5
(B) | E Space after the function name |

Contracts

Consider the following contract:

```
rotate :: (degree :: Number, img :: Image) -> Image
```

What is the **Name** of this function? rotate

How many things are in this function's **Domain**? 2

What is the **type** of this function's **first argument**? Number

What is the **name** of this function's **second argument**? img

What is the **Range** of this function? Image.

Below, circle which expression is the correct application of this function, based on its contract.

1. `rotate(45, 90)`
2. `rotate(circle(99, "solid", "green"))`
3. **`rotate(25, rectangle(7, 10, "outline", "black"))`**
4. `rotate(rectangle(7, 10, "outline", "black"), 25)`

Matching Expressions and Contracts

Match the contract (left) with the expression described by the function being used (right).

Contract	Expression
make-id :: (name :: String, age :: Number) -> Image 1 (B)	A make-id("Hannah", "Smith")
phone-bill :: (minutes :: Number, texts :: Number) -> Number 2 (C)	B make-id("George", 17)
phone-bill :: (minutes :: Number) -> Number 3 (E)	C phone-bill(31, 287)
make-id :: (first :: String, last :: String) -> Image 4 (A)	D make-id("Jessica", "Jones", 32)
make-id :: (first :: String, last :: String, age :: Number) -> Image 5 (D)	E phone-bill(55)

What's on your mind?

Plotting and Displaying Data

Data Scientists use **displays** to visualize data. You've probably seen some of these charts, graphs and plots yourselves! When it comes to displaying **Categorical Data**, there are two displays that are especially useful.

1. **Bar charts** show the *count or percentage* of rows in each category.

- Bar charts provide a visual representation of the frequency of values in a categorical column.
- Bar charts have a bar for every category in a column.
- The more rows in a category, the taller the bar.
- Bars in a bar chart can be shown in *any order*, without changing the meaning of the chart. However, bars are usually shown in some sensible order (bars for the number of orders for different t-shirt sizes might be presented in order of smallest to largest shirt).

2. **Pie charts** show the *percentage* of rows in each category.

- Pie charts provide a visual representation of the relative frequency of values in a categorical column.
- Pie charts have a slice for every category in a column.
- The more rows in a category, the larger the slice.
- Slices in a pie chart can be shown in *any order*, without changing the meaning of the chart. However, slices are usually shown in some sensible order (e.g. slices might be shown in alphabetical order or from the smallest to largest slice).

Exploring Displays

For each type of display, fill in the information below.

Pie Charts	Bar Charts
Sketch a pie chart here.	Sketch a bar chart here.
Pie charts are constructed from <u>1</u> column(s).	Bar charts are constructed from <u>1</u> column(s).
They show <u>categorical</u> data.	They show <u>categorical</u> data.
What does this display tell us? <u>The proportion in which values in a categorical column are represented</u>	What does this display tell us? <u>The proportion in which values in a categorical column are represented - including categories that are not represented</u>

Box Plots	Histograms
Sketch a box plot here	Sketch a histogram here
Box plots are constructed from <u>1</u> column(s), and show <u>quantitative</u> data. What do you think this display tells us? <u>The range of quantitative values in the bottom quarter, top quarter, and the middle quarters. This tells us something about the spread of the data</u>	Histograms are constructed from <u>1</u> column(s), and show <u>quantitative</u> data. What do you think this display tells us? <u>How many values in a quantitative column fall into equally-sized bins. This tells us something about the spread of the data</u>

(More) Exploring Displays

For each type of display, fill in the information below.

Scatter Plot	Linear Regression Plot
<p>Sketch a scatter plot here.</p> <p>Scatter Plots are constructed from <u>2</u> column(s), and show <u>quantitative</u> data. What do you think this display tells us?</p> <p><u>something about the relationship between two quantitative columns, graphing all pairs of values as points on a plane.</u></p> <p><u>This allows us to look for patterns, clusters, trends, etc.</u></p>	<p>Sketch a linear regression plot here.</p> <p>LR Plots are constructed from <u>2</u> column(s), and show <u>quantitative</u> data. What do you think this display tells us?</p> <p><u>something about the relationship between two quantitative columns, graphing all pairs of values as points on a plane,</u></p> <p><u>drawing the line of best fit, and showing correlation stats</u></p>

What's on your mind?

Data Displays and Lookups

Data scientists use data visualizations to gain better insights into their data, and to communicate their findings with others.

Making a display requires answering three questions:

1. **What data** is being displayed? This could be "a random sample of 2000 people", "every animal from the shelter", or "students' aged 14-17".
2. **What variables** are being explored? Are we looking at the `species` column? The number of kilograms that an animal weighs? Searching for a relationship between a person's income and their height ?
3. **What display** is being used, given the variables being explored? If it's a quantitative variable, we might use a histogram or box plot. If it's categorical, we could use a pie or bar chart. If it's two quantitative variables, we probably want a scatter plot.

When **looking up a data Row** from a Table, programmers use the `row-n` method. This method takes a single number as its input, which tells the computer which Row we want. *Note: Rows are numbered starting at zero!*

For example:

```
animals-table.row-n(0) # access the 1st data row  
animals-table.row-n(16) # access the 17th data row
```

When **looking up a column** from a Row, programmers use square brackets and the name of the column they want.

For example:

```
animals-table.row-n(11) ["age"]      # look up the age of the animal in the 12st data row  
animals-table.row-n(14) ["species"]   # look up the species of the animal in the 15th data row
```

Throughout the rest of the workbook, we will sometimes refer to `animalA` and `animalB`.

```
animalA = animals-table.row-n(4)  
animalB = animals-table.row-n(13)
```

What Display Goes with Which Data?

Match the Display with the description of the data being plotted. Some descriptions may go with more than one display!

Pie Charts 1
(C)

A 1 column of Quantitative Data

Bar Charts 2
(C)

Histograms 3
(A)

B 2 columns of Quantitative Data

Box Plots 4
(A)

Scatter Plots 5
(B)

C 1 column of Categorical Data

Data Displays

Fill in the tables below, then use Pyret to make the following displays. Record the code you used.

The first column has been filled in for you.

1) A pie-chart showing the species of animals from the shelter.

Which Rows?	Which Column(s)?	What Display?
All the animals	species	pie chart

code: `pie-chart(animals-table, "species")`

2) A bar-chart showing the sex of animals from the shelter.

Which Rows?	Which Column(s)?	What Display?
All the animals	sex	bar chart

code: `bar-chart(animals-table, "sex")`

3) A histogram of the number of pounds that animals weigh.

Which Rows?	Which Column(s)?	What Display?
All the animals	pounds	histogram

code: `histogram(animals-table, "pounds", 10)`

4) A box-plot of the number of pounds that animals weigh.

Which Rows?	Which Column(s)?	What Display?
All the animals	pounds	box plot

code: `box-plot(animals-table, "pounds")`

5) A scatter-plot, using the animals' species as the labels, age as the x-axis, and pounds as the y-axis.

Which Rows?	Which Column(s)?	What Display?
All the animals	species, age and pounds	scatter plot

code: `scatter-plot(animals-table, "species", "age", "pounds")`

6) A scatterplot, using the animals' name as the labels, pounds as the x-axis, and weeks as the y-axis.

Which Rows?	Which Column(s)?	What Display?
All the animals	name, pounds and weeks	scatter plot

code: `scatter-plot(animals-table, "name", "pounds", "weeks")`

Lookup Questions

The table below represents four pets at an animal shelter:

`pets-table`

name	sex	age	pounds
"Toggle"	"female"	3	48
"Fritz"	"male"	4	92
"Nori"	"female"	6	35.3
"Maple"	"female"	3	51.6

1) Match each Lookup Question (left) to the code that will give the answer (right).

- | | | |
|---------------------------------------|-----------------|--|
| "How much does Maple weigh?" | 1
(E) | A <code>pets-table.row-n(3)</code> |
| "Which is the last row in the table?" | 2
(A) | B <code>pets-table.row-n(2) ["name"]</code> |
| "What is Fritz's sex?" | 3
(C) | C <code>pets-table.row-n(1) ["sex"]</code> |
| "What's the third animal's name?" | 4
(B) | D <code>pets-table.row-n(3) ["age"]</code> |
| "How much does Nori weigh?" | 5
(G) | E <code>pets-table.row-n(3) ["pounds"]</code> |
| "How old is Maple?" | 6
(D) | F <code>pets-table.row-n(0)</code> |
| "What is Toggle's sex?" | 7
(H) | G <code>pets-table.row-n(2) ["pounds"]</code> |
| "What is the first row in the table?" | 8
(F) | H <code>pets-table.row-n(0) ["sex"]</code> |

2) Fill in the blanks (left) with code that will produce the value (right).

a.	<code>pets-table.row-n(3) ["name"]</code>	"Maple"
b.	<code>pets-table.row-n(1) ["sex"]</code>	"male"
c.	<code>pets-table.row-n(1) ["age"]</code>	4
d.	<code>pets-table.row-n(0) ["pounds"]</code>	48
e.	<code>pets-table.row-n(2) ["name"]</code>	"Nori"

What's on your mind?

Defining Functions

We can **define our own functions**, using a technique called the **Design Recipe**.

- We use the Design Recipe to help us define functions **and think through problems clearly**.
- The first step is to write a **Contract and Purpose Statement** for the function, which specify the Name, Domain and Range of the function and give a summary of what it does.
- The second step is to **write at least two examples**, which show how the function should work for specific inputs. These examples help us see patterns, and we express those patterns by **circling and labeling** what changes.
- The final step is to **define the function**, which generalizes our examples.

The Design Recipe

Directions: Define a function called `gt`, which makes solid green triangles of whatever size we want.

Contract and Purpose Statement

Every contract has three parts...

gt:: (size :: Number) -> Image
function name domain range

Consumes a size, and produces a solid green triangle of that size.

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

gt ("10") is triangle(10, "solid", "green")
function name input(s) what the function produces

gt ("20") is triangle(20, "solid", "green")
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun gt(size):

function name variable(s)

triangle(size, "solid", "green")

what the function does with those variable(s)

end

Directions: Define a function called `bc`, which makes solid blue circles of whatever radius we want.

Contract and Purpose Statement

Every contract has three parts...

bc:: (radius :: Number) -> Image
function name domain range

Consumes a radius, and produces a solid blue circle with that radius.

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

bc ("10") is circle(10, "solid", "blue")
function name input(s) what the function produces

bc ("20") is circle(20, "solid", "blue")
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun bc(radius):

function name variable(s)

circle(radius, "solid", "blue")

what the function does with those variable(s)

end

The Design Recipe

Directions: Define a function called `sticker`, which draws 50px stars in whatever color is input.

Contract and Purpose Statement

Every contract has three parts...

#	sticker::	(r :: Row)	->	Image
	<small>function name</small>	<small>domain</small>		<small>range</small>

Consumes a color and produces a solid, 50px star in that color

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

<code>sticker (</code>	<code>"\\"red\\"</code>	<code>) is star(50, "solid", "red")</code>
<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

<code>sticker (</code>	<code>"\\"green\\"</code>	<code>) is star(50, "solid", "green")</code>
<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

end

Definition

Write the definition, giving variable names to all your input values...

<code>fun</code>	<code>sticker(</code>	<code>color</code>	<code>):</code>
	<small>function name</small>	<small>variable(s)</small>	
	<code>star(50, "solid", color)</code>		<small>what the function does with those variable(s)</small>

`end`

Directions: Define a function called `nametag`, which consumes a `Row` of the animals table and draws their name in purple, 10px letters. (Assume you have rows `animalA` and `animalB` defined.)

Contract and Purpose Statement

Every contract has three parts...

#	nametag::	(r :: Row)	->	Image
	<small>function name</small>	<small>domain</small>		<small>range</small>

Consumes an animal, and produces that animal's name in purple, 10px letters.

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

<code>nametag (</code>	<code>"animalA"</code>	<code>) is text(animalA["name"], 10, "purple")</code>
<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

<code>nametag (</code>	<code>"animalB"</code>	<code>) is text(animalB["name"], 10, "purple")</code>
<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

end

Definition

Write the definition, giving variable names to all your input values...

<code>fun</code>	<code>nametag(</code>	<code>r</code>	<code>):</code>
	<small>function name</small>	<small>variable(s)</small>	

`text(r["name"], 10, "purple")`

what the function does with those variable(s)

end

What's on your mind?

Defining Row Functions & Using Table Methods

Methods are special functions that are attached to pieces of data. We use them to manipulate Tables.

- In this course, the methods we'll be using are
 - `row-n` - consumes an index (starting with zero!) and produces a row from a table
 - `order-by` - consumes the name of a column and a Boolean value to determine if that table should be sorted by that column in ascending order
 - `filter` - consumes a *Boolean-producing function*, and produces a table containing only rows for which the function returns `true`
 - `build-column` - consumes the name of a new column, and a function that produces the values in that column for each Row
- Unlike functions, methods can't be used alone. They have a "secret" argument, which is the data they are attached to. They are written as part of that data, separated by a dot. For example:

```
shapes.row-n(2)
```

- Contracts for methods are different from other functions. They include the type of the data as part of their names. For example:

```
<table>.row-n :: (index :: Number) -> Row
```

Reading Function Definitions

Make sure you have the "Table Methods Starter File" open on your computer, and click "Run".

1	How many functions are defined here?	5
2	What are their names?	is-dog, is-old, lookup-name, lookup-fixed, and label
3	What is the domain of is-dog ?	Row
4	What is the range of is-old ?	Boolean
5	What is the range of lookup-name ?	String
6	What does is-fixed(animalA) evaluate to?	true
7	What does lookup-name (animalB) evaluate to?	Midnight
8	What does is-old(animalA) evaluate to?	false
9	What does is-dog (animalA) evaluate to?	false
10	What does is-fixed do?	looks up the value in the fixed column
11	What does lookup-name do?	looks up the value in the name column
12	What does is-old do?	computes whether the value in age is > 10

The Design Recipe

For the word problems below, assume `animalA` and `animalB` are defined as the data rows for Felix and Midnight, respectively.

Directions: Define a function called `lookup-fixed`, which looks up whether or not an animal is fixed.

Contract and Purpose Statement

Every contract has three parts...

`lookup-fixed::` _____ (`r :: Row`) _____ -> _____ Boolean
function name domain range

Consumes an animal, and looks up the value in the fixed column.
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

`lookup-fixed ("animalA") is animalA["fixed"]`

function name input(s) what the function produces

`lookup-fixed ("animalB") is animalB["fixed"]`

function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

`fun lookup-fixed(r):`

function name variable(s)

`r["fixed"]`

what the function does with those variable(s)

end

Directions: Define a function called `lookup-sex`, which consumes a Row of the animals table and looks up the sex of that animal.

Contract and Purpose Statement

Every contract has three parts...

`lookup-sex::` _____ (`r :: Row`) _____ -> _____ String
function name domain range

Consumes an animal, and looks up the sex
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

`lookup-sex ("animalA") is animalA["sex"]`

function name input(s) what the function produces

`lookup-sex ("animalB") is animalB["sex"]`

function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

`fun lookup-sex(r):`

function name variable(s)

`r["sex"]`

what the function does with those variable(s)

end

The Design Recipe

For the word problems below, assume `animalA` and `animalB` are defined as the data rows for Felix and Midnight, respectively.

Directions: Define a function called `is-cat`, which consumes a `Row` of the animals table and computes whether the animal is a cat.

Contract and Purpose Statement

Every contract has three parts...

is-cat: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether the species == "cat"
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

is-cat ("animalA") is animalA["species"] == "cat"
function name input(s) what the function produces
is-cat ("animalB") is animalB["species"] == "cat"
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun is-cat(r):
function name variable(s)
r["species"] == "cat"
what the function does with those variable(s)
end

Directions: Define a function called `is-young`, which consumes a `Row` of the animals table and computes whether it is less than four years old.

Contract and Purpose Statement

Every contract has three parts...

is-young: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether the age is less than 4
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

is-young ("animalA") is animalA["age"] < 4
function name input(s) what the function produces
is-young ("animalB") is animalB["age"] < 4
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun is-young(r):
function name variable(s)
r["age"] < 4
what the function does with those variable(s)
end

What's on your mind?

Method Chaining

Method chaining allows us to apply multiple methods with less code.

For example, instead of using multiple definitions, like this:

```
with-labels = animals-table.build-column("labels", nametag)
cats = with-labels.filter(is-cat)
cats.order-by("age", true)
```

We can use method-chaining to write it all on one line, like this:

```
animals-table.build-column("labels", nametag).filter(is-cat).order-by("age", true)
```

Order Matters! The methods are applied in the order they appear. For example, trying to order a table by a column that hasn't been built will result in an error.

The Design Recipe

For the word problems below, assume you have `animalA` and `animalB` defined in your code.

Directions: Define a function called `is-dog`, which consumes a Row of the animals table and computes whether the animal is a dog.

Contract and Purpose Statement

Every contract has three parts...

is-dog:: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether the species == "dog"
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

is-dog ("animalA") is animalA["species"] == "dog"
function name input(s) what the function produces
is-dog ("animalB") is animalB["species"] == "dog"
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun is-dog(r):
function name variable(s)
r["species"] == "dog"
what the function does with those variable(s)

end

Directions: Define a function called `is-female`, which consumes a Row of the animals table and returns true if the animal is female.

Contract and Purpose Statement

Every contract has three parts...

is-female:: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether it's female
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

is-female ("animalA") is animalA["sex"] == "female"
function name input(s) what the function produces
is-female ("animalB") is animalB["sex"] == "female"
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun is-female(r):
function name variable(s)
r["sex"] == "female"
what the function does with those variable(s)

end

The Design Recipe

For the word problems below, assume you have `animalA` and `animalB` defined in your code.

Directions: Define a function called `is-old`, which consumes a Row of the animals table and computes whether it is more than 12 years old.

Contract and Purpose Statement

Every contract has three parts...

is-old:: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether its age is > 12
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

is-old ("animalA") is animalA["age"] > 12
function name input(s) what the function produces
is-old ("animalB") is animalB["age"] > 12
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun is-old(r):
function name variable(s)
r["age"] > 12
what the function does with those variable(s)
end

Directions: Define a function called `name-has-s`, which returns true if an animal's name contains the letter "s"

Contract and Purpose Statement

Every contract has three parts...

name-has-s:: (r :: Row) -> Boolean
function name domain range
Consumes an animal, and computes whether its name contains an "s"
what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

name-has-s ("animalA") is string-contains(animalA["name"], "s")
function name input(s) what the function produces
name-has-s ("animalB") is string-contains(animalB["name"], "s")
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun name-has-s(r):
function name variable(s)
string-contains(r["name"], "s")
what the function does with those variable(s)
end

Chaining Methods

You have the following functions defined below (read them *carefully!*):

```
fun is-fixed(r): r["fixed"]           end
fun is-young(r): r["age"] < 4         end
fun nametag(r):  text(r["name"], 20, "red") end
```

The table `t` below represents four animals from the shelter:

name	sex	age	fixed	pounds
"Toggle"	"female"	3	true	48
"Fritz"	"male"	4	true	92
"Nori"	"female"	6	true	35.3
"Maple"	"female"	3	true	51.6

Match each Pyret expression (left) to the description of what it does (right).

- | | | |
|---|-----------------|---|
| <code>t.order-by("age", true)</code> | 1
(C) | A Produces a table containing only Toggle and Maple |
| <code>t.filter(is-fixed)</code> | 2
(F) | B Produces a table of only young, fixed animals |
| <code>t.build-column("sticker", nametag)</code> | 3
(D) | C Produces a table, sorted youngest-to-oldest |
| <code>t.filter(is-young)</code> | 4
(A) | D Produces a table with an extra column, named "sticker" |
| <code>t.filter(is-young).filter(is-fixed)</code> | 5
(B) | E Produces a table containing Maple and Toggle, in that order |
| <code>t.filter(is-young).order-by("pounds", false)</code> | 6
(E) | F Produces a table containing the same four animals |
| <code>t.build-column("label", nametag).order-by("age", true)</code> | 7
(H) | G Won't run: will produce an error |
| <code>t.order-by("gindr", false)</code> | 8
(G) | H Produces a table with an extra "label" column, sorted youngest-to-oldest |

Chaining Methods 2: Order Matters!

You have the following functions defined below (read them *carefully!*):

```
fun is-female(r): r["sex"] == "female"    end
fun kilograms(r): r["pounds"] / 2.2        end
fun is-heavy(r):  r["kilos"] > 25          end
```

The table `t` below represents four animals from the shelter:

name	sex	age	fixed	pounds
"Toggle"	"female"	3	true	48
"Fritz"	"male"	4	true	92
"Nori"	"female"	6	true	35.3
"Maple"	"female"	3	true	51.6

Match each Pyret expression (left) to the description of what it does (right). Note: one description might match multiple expressions!

`t.order-by("kilos", true)`

1
(D)

A Produces a table containing Toggle, Nori and Maple, with an extra column showing their weight in kilograms

`t.filter(is-female)
 .build-column("kilos",
 kilograms)`

2
(A)

B Produces a table containing Maple, Nori and Toggle (in that order)

`t.build-column("kilos",
kilograms)
 .filter(is-heavy)`

3
(C)

C Produces a table containing only Fritz.

`t.filter(is-heavy)
 .build-column("kilos",
 kilograms)`

4
(D)

D Won't run: will produce an error

`t.build-column("kilos",
kilograms)
 .filter(is-heavy)
 .order-by("sex", true)`

5
(C)

E Produces a table containing only Fritz, with two extra columns.

`t.build-column("female",
is-female)
 .build-column("kilos",
 kilograms)
 .filter(is-heavy)`

6
(E)

F Produces a table containing Maple and Fritz

What's on your mind?

Mood Generator

1) Open the Mood Generator starter file, and read through the code you find there. This code contains new programming that you haven't seen yet! Take a moment to list everything you Notice, and then everything you Wonder...

Notice	Wonder
(sample responses) I notice the usual imports at the top, including defining the animals table and the spreadsheet. I notice what looks like a function definition, but I see if/else in there	(sample responses) I wonder what if/else are all about...

2) Add another line of code to the definition, so that `mood ("mad")` produces the *same emoji* as `mood ("angry")`.

```
else if (feeling == "mad") : "😊"
```

3) Add **another example** to the `examples:` section for "laughing", using the appropriate emoji.

```
mood("laughing") is "😂"
```

4) Come up with some new moods, and add them to the code. Make sure you include `examples: !`

(depends on student choice - look for missing quotes, new lines in the definition without lines in the examples, etc.)

5) In your own words, how do if-expressions work in Pyret? Write your answer below.

Every if-expression has a test, which contains a boolean expression. If the test is true, Pyret evaluates whatever comes after it.

Otherwise, it evaluates whatever comes after the `else:`

6) Write down at least 2 ways you could use if-expressions when analyzing the Animals Dataset.

Word Problem: species-color

Directions: We want to generate a custom dot for our `image-scatter-plot`, such that every species gets a unique color.

Write a function called `species-color`, which takes in a Row from the animals table and returns a solid, 5px circle using a color you've chosen.

Contract and Purpose Statement

Every contract has three parts...

`species-color::` _____ Row _____ -> _____ Image
function name domain range

Consumes an animal, and produces a solid, 5px dot. (Dogs=red, Cats=blue, Tarantulas=black, Rabbits=pink, Lizards=green)

Examples

what does the function do?

Write some examples, then circle and label what changes...

examples:

<code>species-color (</code>	<u>"dog"</u>	<code>) is circle(5px, "solid", "red")</code>
function name	input(s)	what the function produces
<code>species-color (</code>	<u>"cat"</u>	<code>) is circle(5px, "solid", "blue")</code>
function name	input(s)	what the function produces
<code>species-color (</code>	<u>"tarantula"</u>	<code>) is circle(5px, "solid", "black")</code>
function name	input(s)	what the function produces
<code>species-color (</code>	<u>"rabbit"</u>	<code>) is circle(5px, "solid", "pink")</code>
function name	input(s)	what the function produces
<code>species-color (</code>	<u>"lizard"</u>	<code>) is circle(5px, "solid", "green")</code>
function name	input(s)	what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

```
fun species-color( r ):  
    function name variable(s)  
if (r["species"] == "dog"): circle(5px, "solid", "red")  
        what the function does with those variable(s)  
else if (r["species"] == "cat"): circle(5px, "solid", "blue")  
        what the function does with those variable(s)  
else if (r["species"] == "tarantula"): circle(5px, "solid", "black")  
        what the function does with those variable(s)  
else if (r["species"] == "rabbit"): circle(5px, "solid", "pink")  
        what the function does with those variable(s)  
else if (r["species"] == "lizard"): circle(5px, "solid", "green")  
        what the function does with those variable(s)  
end  
end
```

Randomness and Sample Size

Computer Scientists may take **samples** that are subsets of a data set. If their sample is well chosen, they can use it to test if their code does what it's supposed to do. However, choosing a good sample can be tricky!

Random Samples are a subset of a population in which each member of the subset has an equal chance of being chosen. A random sample is intended to be a representative subset of the population. The larger the random sample, the more closely it will represent the population and the better our inferences about the population will tend to be.

Grouped Samples are a subset of a population in which each member of the subset was chosen for a specific reason. For example, we might want to look at the difference in trends between two groups ("Is the age of a dog a bigger factor in adoption time v. the age of a cat?"). This would require making grouped samples of *just the dogs* and *just the cats*.

Sampling and Inference

1) Evaluate the `big-animals-table` in the Interactions Area. This is the *complete* population of animals from the shelter!

Below is a true statement about that population:

The population is 47.7% fixed and 52.3% unfixed.

2) How close to these percentages do we get with random samples?

Type each of the following lines into the Interactions Area and hit "Enter".

```
random-rows(big-animals-table, 10)  
random-rows(big-animals-table, 40)
```

3) What do you get?

Two tables, with 10 and 40 rows. Rows seem randomly chosen.

4) What is the contract for `random-rows` ? _____ # `random-rows :: (t :: Table, size :: Number) -> Table`

5) What does the `random-rows` function do?

Given a table and a sample size, it randomly selects that many rows from the table.

6) In the Definitions Area, define `tiny-sample` and `small-sample` to be these two random samples.

7) Make a `pie-chart` for the animals in each sample, showing percentages of fixed and unfixed.

- The percentage of fixed animals in the entire populations is 47.7%.
- The percentage of fixed animals in `tiny-sample` is (answers will vary).
- The percentage of fixed animals in `small-sample` is (answers will vary less).

8) Make a `pie-chart` for the animals in each sample, showing percentages for each species.

- The percentage of tarantulas in the entire population is roughly 5%.
- The percentage of tarantulas in `tiny-sample` is (answers will vary).
- The percentage of tarantulas in `small-sample` is (answers will vary less).

9) Click "Run" to direct the computer to generate a different set of random samples of these sizes. Make a new `pie-chart` for each sample, showing percentages for each species.

- The percentage of tarantulas in the entire population is roughly 5%.
- The percentage of tarantulas in `tiny-sample` is (answers will vary).
- The percentage of tarantulas in `small-sample` is (answers will vary less).

10) Which repeated sample gave us a more accurate inference about the whole population? Why?

The `small-sample` was more accurate, because larger samples are more likely to represent the population they are drawn from.

Grouped Samples from the Animals Dataset

Use method chaining to define the **grouped samples** below, using the helper functions that you've already defined: `is-old`, `is-young`, `is-cat`, `is-dog`, `is-female`, `lookup-fixed`, and `has-s-name`. We've given you the solution for the first sample, to get you started.

Subset	The code to define that subset
Kittens	<code>kittens = animals-table.filter(is-cat).filter(is-young)</code>
Puppies	<code>young-dogs = animals-table.filter(is-young).filter(is-dog)</code>
Fixed Cats	<code>fixed-cats = animals-table.filter(is-fixed).filter(is-cat)</code>
Cats with "s" in their name	<code>s-cats = animals-table.filter(is-cat).filter(has-s-name)</code>
Old Dogs	<code>old = animals-table.filter(is-dog).filter(is-old)</code>
Fixed Animals	<code>fixed = animals-table.filter(is-fixed)</code>
Old Female Cats	<code>old-f-cats = animals-table.filter(is-old).filter(is-female).filter(is-cat)</code>
Fixed Kittens	<code>young-fixed-cats = fixed-cats.filter(is-young)</code>
Fixed Female Dogs	<code>fixed-female-dogs = fixed.filter(is-female).filter(is-dog)</code>
Old Fixed Female Cats	<code>old-fixed-f-cats = old-f-cats.filter(is-fixed).filter(is-female).filter(is-cat)</code>

Displaying Data

Fill in the tables below, then use Pyret to make the following displays. Record the code you used.

The first table has been filled in for you.

1) A bar-chart showing how many puppies are fixed or not.

What Rows?	Which Column(s)?	What Display?
puppies	fixed	bar-chart

code: `bar-chart(animals-table.filter(is-dog).filter(is-young), "fixed")`

2) A pie-chart showing how many heavy dogs are fixed or not.

What Rows?	Which Column(s)?	What Display?
heavy dogs	fixed	pie-chart

code: `pie-chart(animals-table.filter(is-dog).filter(is-heavy), "fixed")`

3) A histogram of the number of weeks it takes for a random sample of animals to be adopted.

What Rows?	Which Column(s)?	What Display?
random sample	weeks	histogram

code: `histogram(random-rows(animals-table, 50), "weeks")`

4) A box-plot of the number of pounds that kittens weigh.

What Rows?	Which Column(s)?	What Display?
kittens	pounds	box-plot

code: `box-plot(animals-table.filter(is-cat).filter(is-young), "pounds")`

5) A scatter-plot of a random sample using species as the labels, age as the x-axis, and weeks as the y-axis.

What Rows?	Which Column(s)?	What Display?
random sample	species, weeks, and age	scatter-plot

code: `scatter-plot(random-rows(animals-table, 45), "name", "age", "weeks")`

6) A scatter-plot of fixed cats, using name as the labels, pounds as the x-axis, and weeks as the y-axis.

What Rows?	Which Column(s)?	What Display?
fixed cats	name, pounds, and weeks	scatter-plot

code: `scatter-plot(animals-table.filter(is-cat).filter(is-fixed), "species", "pounds", "weeks")`

What's on your mind?

Choosing Your Dataset

When selecting a dataset to explore, *pick something that matters to you!* You'll be working with this data for a while, so you don't want to pick something at random just to get it done.

When choosing a dataset, it's a good idea to consider a few factors:

1. Is it **interesting**? This should be data you are curious about, that answers questions you'd want to ask. Pick a dataset you're genuinely interested in, so that you can explore questions that matter to you!
2. Is it **relevant**? Does this data impact you in any way? Are there questions you have about the dataset that mean something to you or someone you know? Pick a dataset that deals with something personally relevant to you!
3. Is it **familiar**? You wouldn't be able to make samples of the Animals Dataset properly if you didn't know that some animals are much bigger or longer-lived than others. Pick a dataset you know about, so you can use your expertise to deepen your analysis!

My Dataset

I chose to work with the _____ dataset, which contains _____ data rows.

What do you NOTICE?	What do you WONDER?	Question Type
		<i>Lookup</i> <i>Compute</i> <i>Relate</i> <i>Can't answer</i>

Some of the columns are:

1) _____, which contains _____ data. Some example values from this column are:

_____.

2) _____, which contains _____ data. Some example values from this column are:

_____.

Samples from My Dataset

How can we define grouped samples? For a given row `r`, what function will identify if that row is in the sample?

Subset	A function that returns true if a row <code>r</code> is in the subset
	fun _____ (<code>r</code>) : end
	fun _____ (<code>r</code>) : end
	fun _____ (<code>r</code>) : end
	fun _____ (<code>r</code>) : end
	fun _____ (<code>r</code>) : end

The Design Recipe

Write helper functions for **your** dataset, which you can use to define subsets.

Directions : Define a function called _____, which consumes a Row of the table and produces _____.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ Row -> Boolean
function name domain range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces
_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

what the function does with those variable(s)

end

Directions : Define a function called _____, which consumes a Row of the table and produces _____.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ Row -> Boolean
function name domain range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces
_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

what the function does with those variable(s)

end

The Design Recipe

Write your own word problems below, and solve them using the Design Recipe.

Directions : Define a function called _____, which consumes a Row of the table and produces _____.

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ Row -> Boolean
function name domain range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples :

_____ (_____) is _____
function name input(s) what the function produces
_____ (_____) is _____
function name input(s) what the function produces

end

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

what the function does with those variable(s)

end

What's on your mind?

Histograms

To best understand histograms, it's helpful to contrast them first with bar charts.

Bar charts show the number of rows belonging to a given category. The more rows in each category, the taller the bar.

- *Bar charts provide a visual representation of the frequency of values in a categorical column.*
- There's no strict numerical way to order these bars, but **sometimes there's an order** that makes sense. For example, bars for the sales of different t-shirt sizes might be presented in order of smallest to largest shirt.

Histograms show the number of rows that fall within certain intervals, or "bins", on a horizontal axis. The more rows that fall within a particular "bin", the taller the bar.

- *Histograms provide a visual representation of the frequencies (or relative frequencies) of values in a quantitative column.*
- Quantitative data **can always be ordered**, so the bars of a histogram always progress from smallest (on the left) to largest (on the right).
- When dealing with histograms, it's important to select a good **bin size**. If the bins are too small or too large, it is difficult to see the shape of the dataset. Choosing a good bin size can take some trial and error!

The **shape** of a data set tells us which values are more or less common.

- In a **symmetric** data set, values are just as likely to occur a certain distance above the mean as below the mean.
- A data set that is **skewed left** and/or has low outliers has a few values that are unusually low. The histogram for a skewed left dataset has a few data points that are stretched out to the left (lower) end of the x-axis.
- A data set that is **skewed right** and/or high outliers means there are a few values that are unusually high. The histogram for a skewed right dataset has a few data points that are stretched out to the right (higher) end of the x-axis.
- One way to visualize the difference between a histogram of data that is **skewed left** or **skewed right** is to think about the lengths of our toes on our left and right feet. Much like a histogram that is "skewed left", our left feet have smaller toes on the left and a bigger toe on the right. Our right feet have the big toe on the left and smaller toes on the right, more closely resembling the shape of a histogram of "skewed right" data.

The Design Recipe

For the word problems below, assume you have `animalA` and `animalB` defined in your code.

Directions: Define a function called `kilos`, which consumes a Row of the animals table and divides the pounds column by 2.2 to compute the animal's weight in kilograms.

Contract and Purpose Statement

Every contract has three parts...

#	<code>kilos::</code>	(<code>r :: Row</code>)	->	Number
	<small>function name</small>	<small>domain</small>		<small>range</small>
# Consumes an animal, and computes the animal's weight in kilos				<small>what does the function do?</small>

Examples

Write some examples, then circle and label what changes...

examples:

#	<code>kilos ("animalA")</code>	<code>is animalA["pounds"] / 2.2</code>	
	<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>
	<code>kilos ("animalB")</code>	<code>is animalB["pounds"] / 2.2</code>	
	<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

end

Definition

Write the definition, giving variable names to all your input values...

fun	<code>kilos(r):</code>	
	<small>function name</small>	<small>variable(s)</small>
<code>r["pounds"] / 2.2</code>		<small>what the function does with those variable(s)</small>
end		

Directions: Define a function called `smart-dot`, which consumes a Row of the animals table and computes the image of a solid red circle using the animal's pounds as the radius.

Contract and Purpose Statement

Every contract has three parts...

#	<code>smart-dot::</code>	(<code>r :: Row</code>)	->	Image
	<small>function name</small>	<small>domain</small>		<small>range</small>
# Consumes an animal, and computes a solid red circle using the weight in pounds as the radius				<small>what does the function do?</small>

Examples

Write some examples, then circle and label what changes...

examples:

#	<code>smart-dot ("animalA")</code>	<code>is circle(animalA["pounds"], "solid", "red")</code>	
	<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>
	<code>smart-dot ("animalB")</code>	<code>is circle(animalB["pounds"], "solid", "red")</code>	
	<small>function name</small>	<small>input(s)</small>	<small>what the function produces</small>

end

Definition

Write the definition, giving variable names to all your input values...

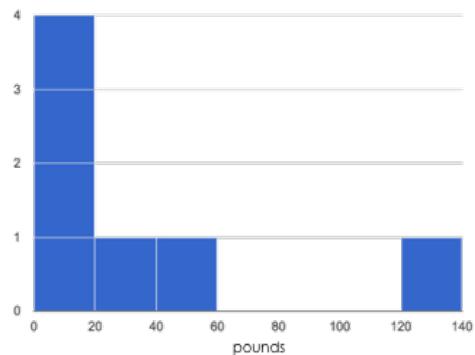

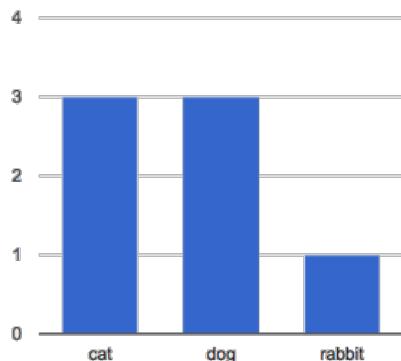

fun	<code>smart-dot(r):</code>	
	<small>function name</small>	<small>variable(s)</small>
<code>circle(r["pounds"], "solid", "red")</code>		<small>what the function does with those variable(s)</small>
end		

Summarizing Columns

name	species	age	pounds
"Sasha"	"cat"	1	6.5
"Boo-boo"	"dog"	11	12.3
"Felix"	"cat"	16	9.2
"Nori"	"dog"	6	35.3
"Wade"	"cat"	1	3.2
"Nibblet"	"rabbit"	6	4.3
"Maple"	"dog"	3	51.6

1	How many cats are there in the table above?	3
2	How many dogs are there?	3
3	How many animals weigh between 0-20 pounds?	5
4	How many animals weigh between 20-40 pounds?	1
5	Are there more animals weighing 40-60 than 60-140 pounds?	yes

The charts below are both based on this table. What is similar about them? What is different?

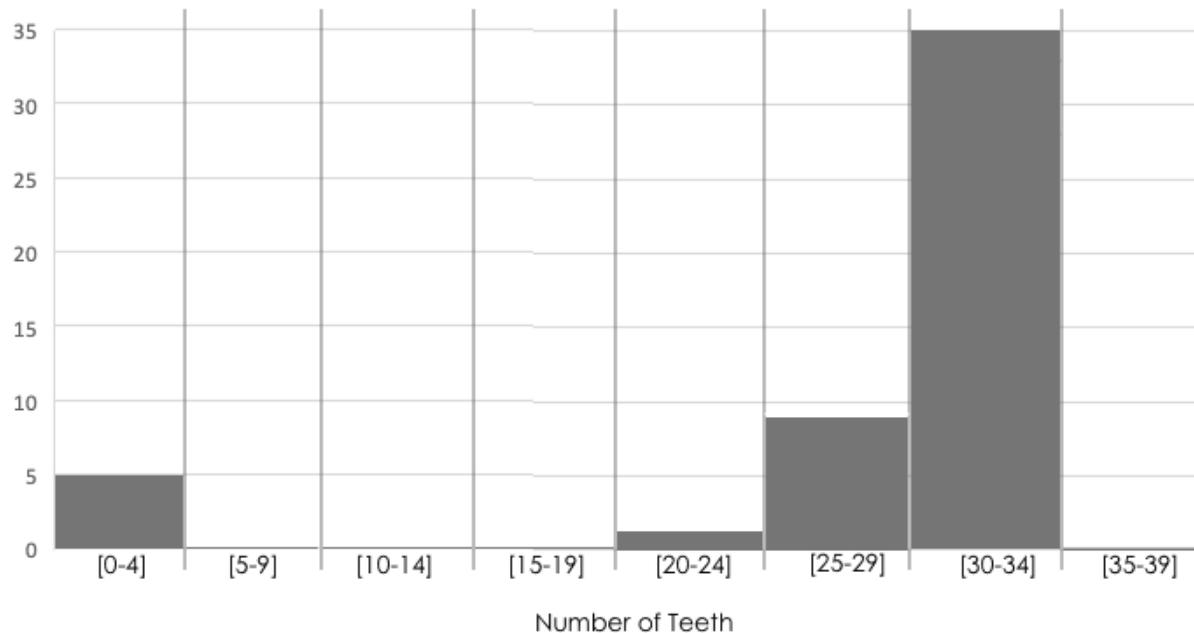

Similarities	Differences
(student responses vary)	(student responses vary)
Both involve blue vertical bars.	The bars are different.
Both show quantity/frequency.	The left uses categorical data. The right uses quantitative data.

Making Histograms

Suppose we have a data set for number of teeth in a group of 50 adults:

Number of teeth	Count
0	5
22	1
26	1
27	1
28	4
29	3
30	5
31	3
32	27

Draw a histogram for the table in the space below. For each row, find which interval (or "bin") on the x-axis represents the right number of teeth. Then fill in the box so that the height of the box is equal to the *sum of the counts* that fit into that interval. One of the intervals has been completed for you.

Reading Histograms

Students watched 5 videos, and rated them on a scale of 1 to 10. While the **average score** for every video is the same (5.5), the **shapes** of the ratings distributions were very different! *Match* the summary description (left) with the histogram of student ratings (right). For each histogram, the **x-axis is the score**, and the **y-axis is the number of students who gave it that score**.

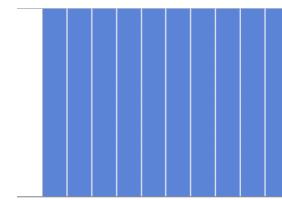

Most of the students were fine with the video, but a couple of them gave it an unusually low rating.

1
(D)

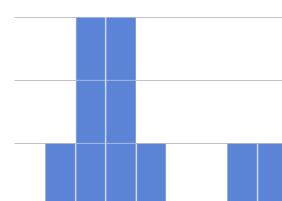

Most of the students were okay with the video, but a couple students gave it an unusually high rating.

2
(C)

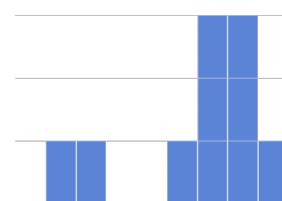

Students tended to give the video an average rating, and they weren't likely to stray far from the average.

3
(A)

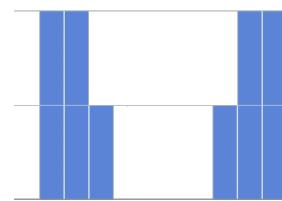

Students either really liked or really disliked the video.

4
(E)

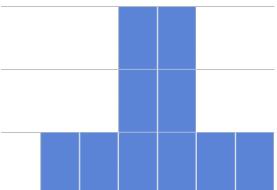

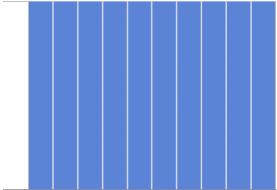

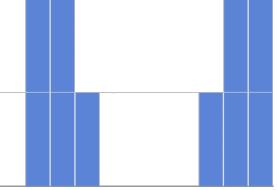

Reactions to the video were all over the place: high ratings and low ratings and inbetween ratings were all equally likely.

5
(B)

Identifying Shape

Describe the shape of histograms on the left in complete sentences, using vocabulary like "Skew Left", "Skew Right", or "Symmetric".

1		Symmetric
2		Symmetric, with no variability!
3		Skew right
4		Skew left
5		This is a <i>little</i> bit of a trick question...it's technically symmetric, but it's really bimodal.

The Shape of the Animals Dataset

Describe two of the histograms you made from your dataset.

1) I made a histogram, showing the distribution of _____ pounds for _____ column in your dataset
animals from the shelter

your subset, e.g., "fixed dogs from the shelter"

2) I made a histogram, showing the distribution of _____ for _____ column in your dataset

your subset, e.g., "fixed dogs from the shelter"

3) What do you Notice and Wonder about these histograms? What shape do they have?

What do you NOTICE?	What do you WONDER?

The Shape of My Dataset

Describe two of the histograms you made from your dataset.

1) I made a histogram, showing the distribution of _____ for _____ column in your dataset

your subset, e.g., "fixed dogs from the shelter"

2) I made a histogram, showing the distribution of _____ for _____ column in your dataset

your subset, e.g., "fixed dogs from the shelter"

3) In the table below, describe the histograms. **Are they symmetric?** Do they show left skewness and/or low outliers? ** Do they show Right skewness and/or high outliers?

What do you NOTICE about these displays?	What do you WONDER about these displays?

What's on your mind?

Measures of Center and Spread

There are three ways to measure the **center** of a dataset, to summarize a whole column of quantitative data using just one number:

- The **mean** of a dataset is the average of all the numbers.
- The **median** of a dataset is a value that is smaller than half the dataset, and larger than the other half. In an ordered list the median will either be the middle number or the average of the two middle numbers.
- The **mode(s)** of a data set is the value (or values) occurring most often. When all of the values occur equally often, a dataset has no mode.

In a **symmetric** dataset, values are just as likely to occur a certain distance above the mean as below the mean, and the median and mean are usually close together.

When a dataset is asymmetric, the median is a more descriptive measure of center than the mean.

- A dataset with **left skew**, and/or low outliers, has a few values that are unusually low, pulling the mean *below* the median.
- A dataset with **right skew**, and/or high outliers, means there are a few values that are unusually high, pulling the mean *above* the median.

When a dataset contains a small number of values, the mode may be the most descriptive measure of center.

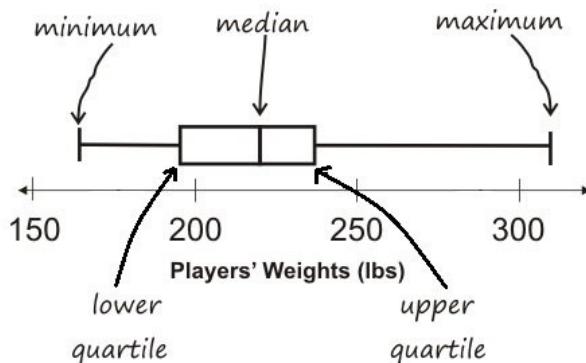

Data Scientists can also measure the **spread** of a dataset using a **five-number summary**:

- The **minimum** – the lowest value in the dataset
- The **first, or “lower” quartile (Q1)** – the middle of the lower half of values, which separates the lowest quarter from the next smallest quarter
- The **second quartile (Q2)** – the middle value, which separates the entire dataset into “top” and “bottom” halves
- The **third, or “upper” quartile (Q3)** – the middle of the higher half of values which separates the second highest quarter from the highest quarter
- The **maximum** – the largest value in the dataset

Measures of Center and Spread (continued)

The **five-number summary** can be used to draw a **box plot**.

- Each of the four sections of the box plot contains 25% of the data. *If the values are distributed evenly across the range, the four sections of the box plot will be equal in width.* Uneven distributions will show up as differently-sized sections of a box plot.
- The left **whisker** extends from the minimum to Q1.
- The **box**, or **interquartile range**, extends from Q1 to Q3. It is divided into 2 parts by the **median**. Each of those parts contains 25% of the data, so the whole box contains the central 50% of the data.
- The right **whisker** extends from Q3 to the maximum.

The box plot above, for example, tells us that:

- The minimum weight is about 165 pounds. The median weight is about 220 pounds. The maximum weight is about 310 pounds.
 - 1/4 of the players weigh roughly between 165 and 195 pounds
 - 1/4 of the players weigh roughly between 195 and 220 pounds
 - 1/4 of the players weigh roughly between 220 and 235 pounds
 - 1/4 of the players weigh roughly between 235 and 310 pounds
 - 50% of the players weigh roughly between 165 and 220 pounds
 - 50% of the players weigh roughly between 195 and 235 pounds
 - 50% of the players weigh roughly between 220 and 310 pounds
- The densest concentration of players' weights is between 220 and 235 pounds.
- Because the widest section of the box plot is between 235 and 310 pounds, we understand that the weights of the heaviest 25% fall across a wider span than the others. 310 may be an outlier, the weights of the players weighing between 235 pounds and 310 pound could be evenly distributed across the range, or all of the players weighing over 235 pounds may weigh around 310 pounds.

Summarizing Columns in the Animals Dataset

Find the measures of center and spread to summarize the _____ pounds column of the Animals Table.

Be sure to add examples to your Contracts page as you work.

Measures of Center

The three measures of center for this column are:

Mean (Average)	Median	Mode(s)
approx. 39.7	11.3	[list: 0.1, 6.5]

Since the mean is _____ higher compared to the median, this suggests the shape is

[higher/lower/about equal]

skewed right .

[skewed right (or high outliers) / skewed left (or low outliers) / symmetric]

Measures of Spread

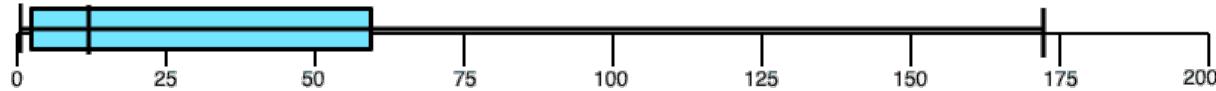

My five-number summary is:

Minimum	Q1	Median	Q3	Maximum
0.1	3.9	11.3	60.4	172

Displaying Center and Spread with a Box Plot

Draw a box plot from this summary on the number line below.

Be sure to label the number line with consistent intervals.

From this summary and box-plot, I conclude:

While the animals' weights range from 0.1 pounds to 172 pounds,

50% of the animals weigh 11.3 pounds or less. The animal that

weighs 172 pounds may be an outlier.

Interpreting Spread

Consider the following dataset, representing the annual income of ten people.

All numbers represent *thousands of dollars* (so 14 means "\$14,000"):

60, 10, 21, 180, 14, 20, 45, 35, 45, 170

1) In the space below, rewrite this dataset in **sorted order**.

10, 14, 20, 21, 35, 45, 45, 60, 170, 180

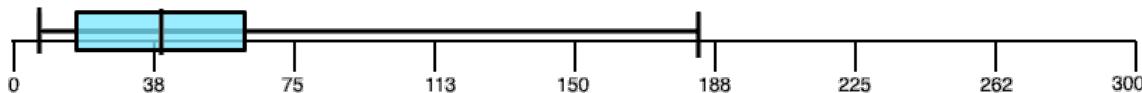

2) In the table below, compute the **measures of center** for this dataset.

Mean (Average)	Median	Mode(s)
60	40	45

3) In the table below, compute the **five number summary** of this dataset.

Minimum	Q1	Q2 (Median)	Q3	Maximum
10	20	40	60	180

4) On the number line below, draw a **box plot** for this dataset.

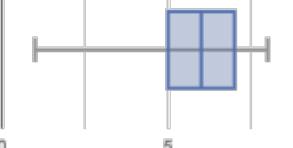

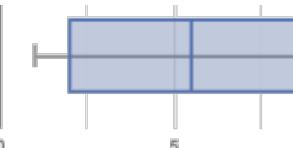

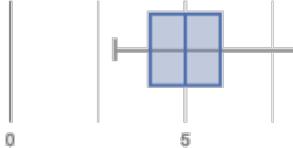

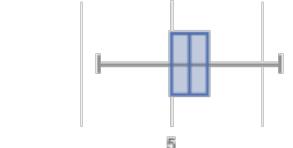

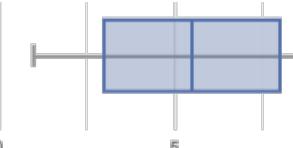

5) The following statements are *correct ... but misleading*. Write down the reason why.

Statement	Why it's misleading
"They're rich! The average person makes \$60k dollars!"	The mean is easily manipulated by a few outliers. For a dataset with this skew, median would have been a better measure.
"It's a middle-income list: the most common salary is \$45k/yr!"	This is true, but mode should rarely be used for quantitative data with as much variability as this. The fact that \$45k appears twice doesn't tell us enough information about the shape for this claim to be valid.
"This group is really diverse, with people making as little as 10k and as much as \$280k!"	Two data points - especially the extremes! - should not be used to make a claim about shape.

Identifying Shape

Describe the shape of box plots on the left in complete sentences, using vocabulary like "Skewed Left", "Skewed Right" or "Symmetric".

1		Skew Right
2		Symmetric (Sort of a trick question, since this is really bimodal)
3		Skew Left
4		Symmetric
5		Symmetric (All values equally likely)

Shape of My Dataset

Find the measures of center and spread to summarize a column of your dataset.

The column I chose to summarize is _____.

Measures of Center

The three measures of center for this column are:

Mean (Average)	Median	Mode(s)

Since the mean is _____ compared to the median, this suggests the shape is
[higher/lower/about equal]

[skewed right (or high outliers) / skewed left (or low outliers) / symmetric]

Measures of Spread

My five-number summary is:

Minimum	Q1	Q2 (Median)	Q3	Maximum

Displaying Center and Spread with a Box Plot

Draw a box plot from this summary on the number line below.

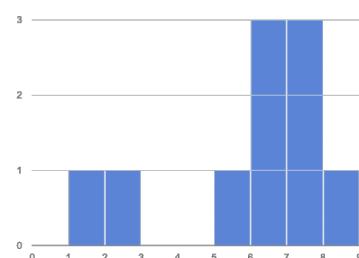

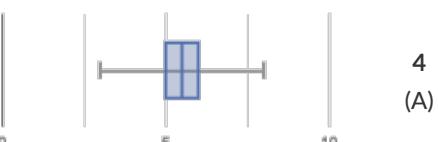

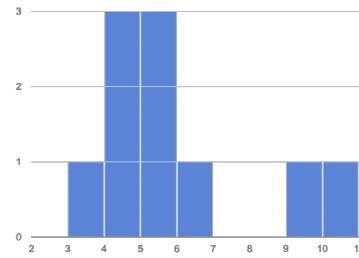

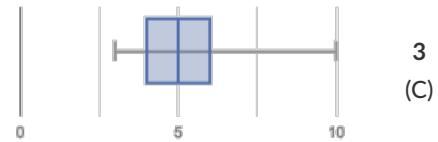

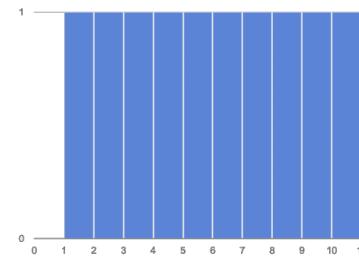

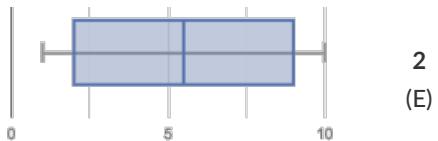

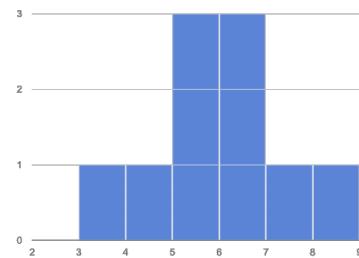

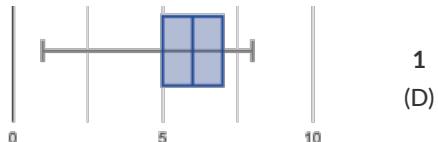

Be sure to label the number line with consistent intervals.

From this summary and box plot, I conclude:

Matching Box-Plots to Histograms

Students watched 5 videos, and rated them on a scale of 1 to 10. For each video, their ratings were used to generate box-plots and histograms. Match the box-plot to the histogram that displays the same data.

What's on your mind?

“Trust, but verify ...”

A “helpful” Data Scientist gives you access to the following functions:

```
# fixed-cats :: (animals :: Table) -> Table
# consumes a table of animals, and produces a table containing only
# cats that have been fixed, sorted from youngest-to-oldest
```

You can use the function, *but you can't see the code for it!* **How do you know if you can trust their code?**

HINT:

- You could make a *verification subset* that contains one of every species, and make sure that the function filters out everything but cats
- You could make sure this subset has multiple cats not already ordered of youngest-to-oldest, and make sure the function puts them in the right order

1) What other qualities would this subset need to have?

It should contain animals - especially cats - that are fixed and unfixed

2) Create your verification subset! In the space below, list the name of each animal in your subset.

Name

This will be different for each student

“Trust, but verify...”

A “helpful” Data Scientist gives you access to the following functions:

```
# old-dogs-nametags:: (animals :: Table) -> Table
# consumes a table of animals, and produces a table containing only
# dogs 5 years or older, with an extra column showing their name in red
```

You can use the function, *but you can't see the code for it!* How do you know if you can trust their code?

- 1) What qualities would a verification subset need to have?

At least one of each species, to make sure non-dogs are filtered out

Animals - especially dogs - whose ages are both \geq and $<$ than 5

At least two old dogs with different names

- 2) Create your verification subset! In the space below, list the name and index of each animal in your subset.

Name

This will be different for each student

What's on your mind?

Scatter Plots

Scatter Plots can be used to show a relationship between two quantitative columns. Each row in the dataset is represented by a point, with one column providing the x-value and the other providing the y-value. The resulting “point cloud” makes it possible to look for a relationship between those two columns.

- If the points in a scatter plot appear to follow a straight line, it is possible that a linear relationship exists between those two columns. A number called a **correlation** can be used to summarize this relationship.
- r is the name of the **correlation statistic**. The r -value will always fall between -1 and $+1$. The sign tells us whether the correlation is positive or negative. Distance from 0 tells us the strength of the correlation.
 - -1 or $+1$ is really strong.
 - 0 means no correlation.
- The correlation is **positive** if the point cloud slopes up as it goes farther to the right. It is **negative** if it slopes down as it goes farther to the right. If the points are tightly clustered around a line, it is a **strong** correlation. If they are loosely scattered, it is a **weak** correlation.
- Points that are far above or below the cloud of points in a scatter plot are called **outliers**.
- We graphically summarize this relationship by drawing a straight line through the data cloud, so that the vertical distance between the line and each of the points is as small as possible. This line is called the **line of best fit** and allows us to predict y-values based on x-values.

(Dis)Proving a Claim

Smaller animals get adopted faster because they're easier to care for."

Do you agree? If so, why?

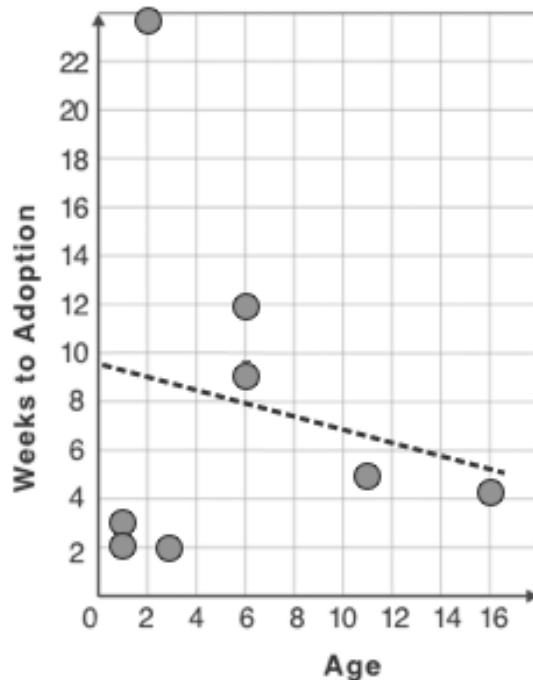

I hypothesize ...

What would you look for in the dataset to see if you are right?

Creating a Scatter Plot

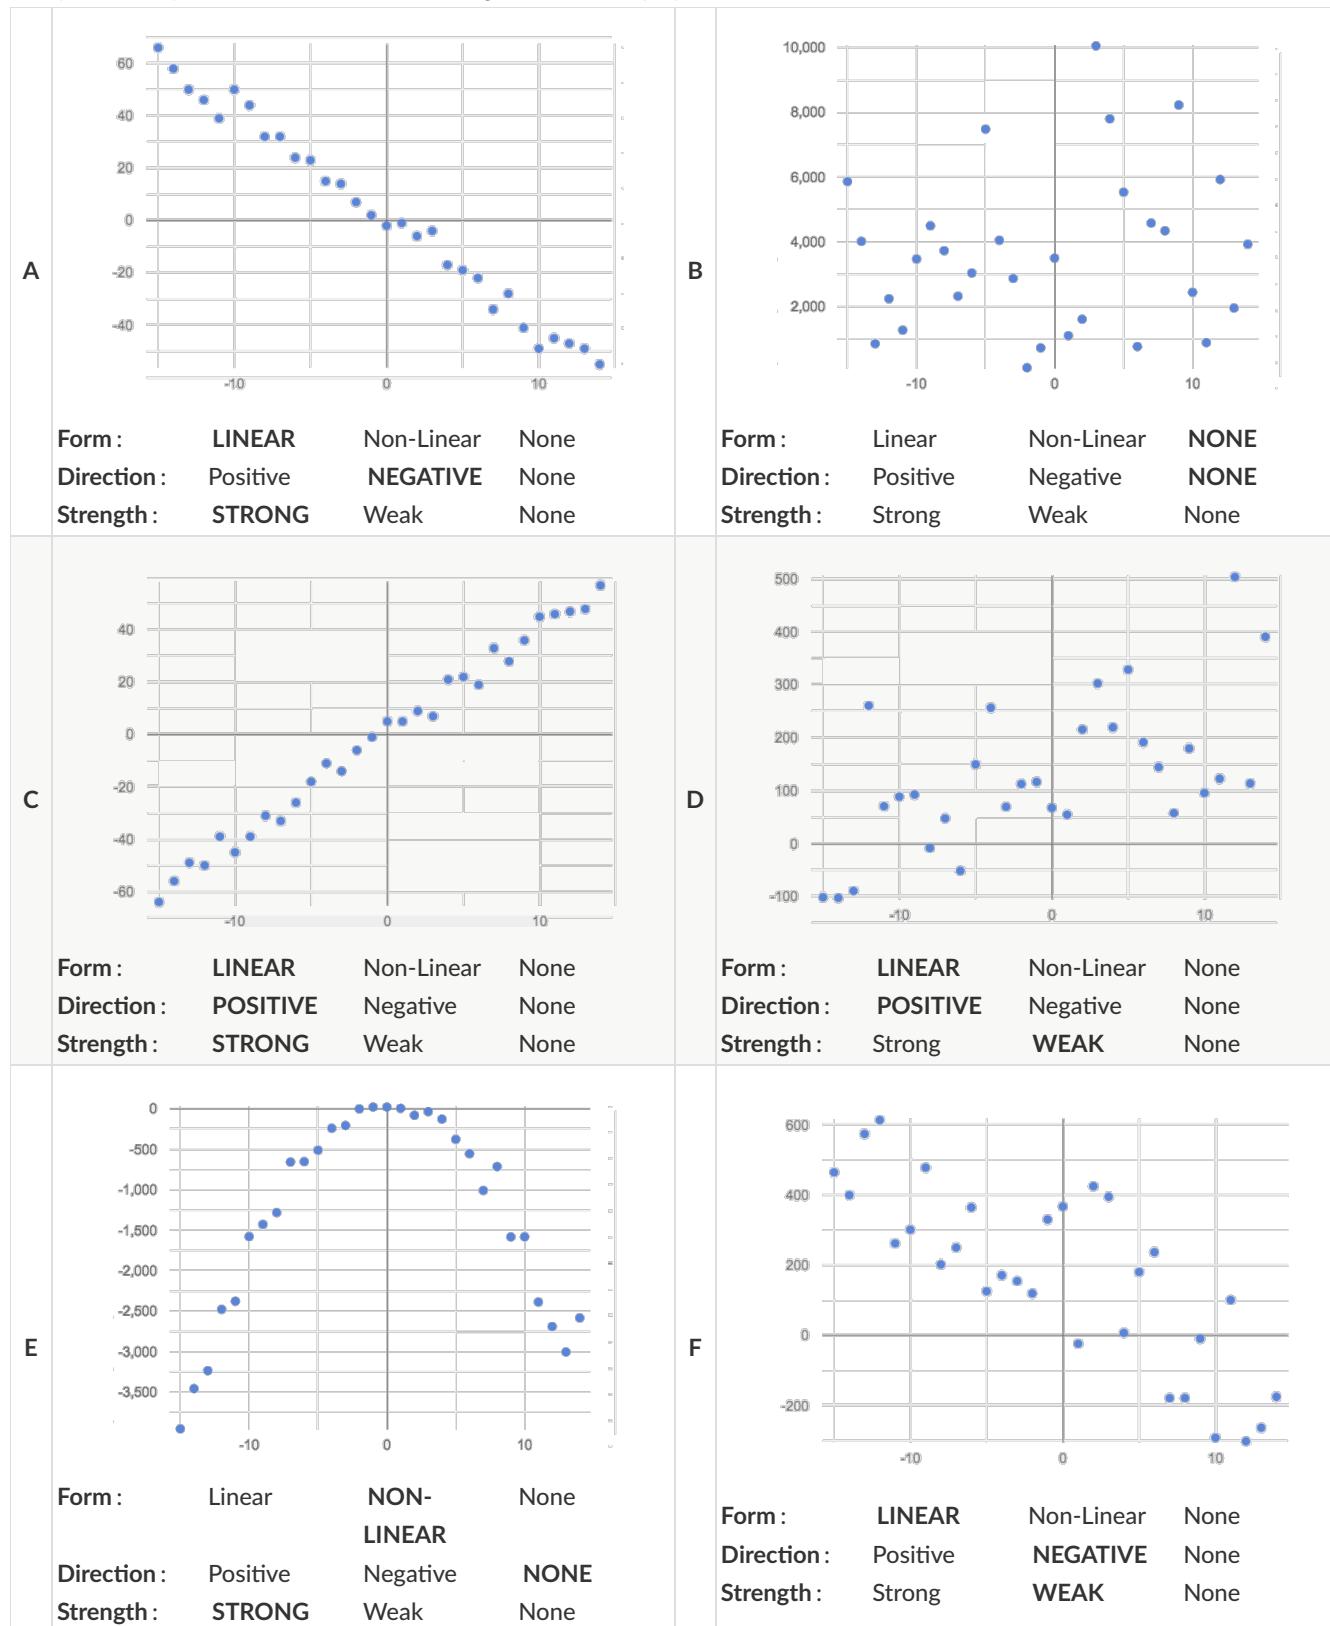

- For each row in the Sample Table on the left, add a point to the scatter plot on the right. The first 3 rows have been completed for you. Use the values from the age column for the x-axis, and values from the weeks column for the y-axis.
- Do you see a pattern? Do the points seem to shift up or down as age increases? Draw a line on the scatter plot to show this pattern.
- Does the line slope upwards or downwards? downward
- Are the points clustered around the line? Loosely scattered? loosely scattered

name	species	age	weeks
"Sasha"	"cat"	1	3
"Boo-boo"	"dog"	11	5
"Felix"	"cat"	16	4
"Buddy"	"lizard"	2	24
"Nori"	"dog"	6	9
"Wade"	"cat"	1	2
"Nibblet"	"rabbit"	6	12
"Maple"	"dog"	3	2

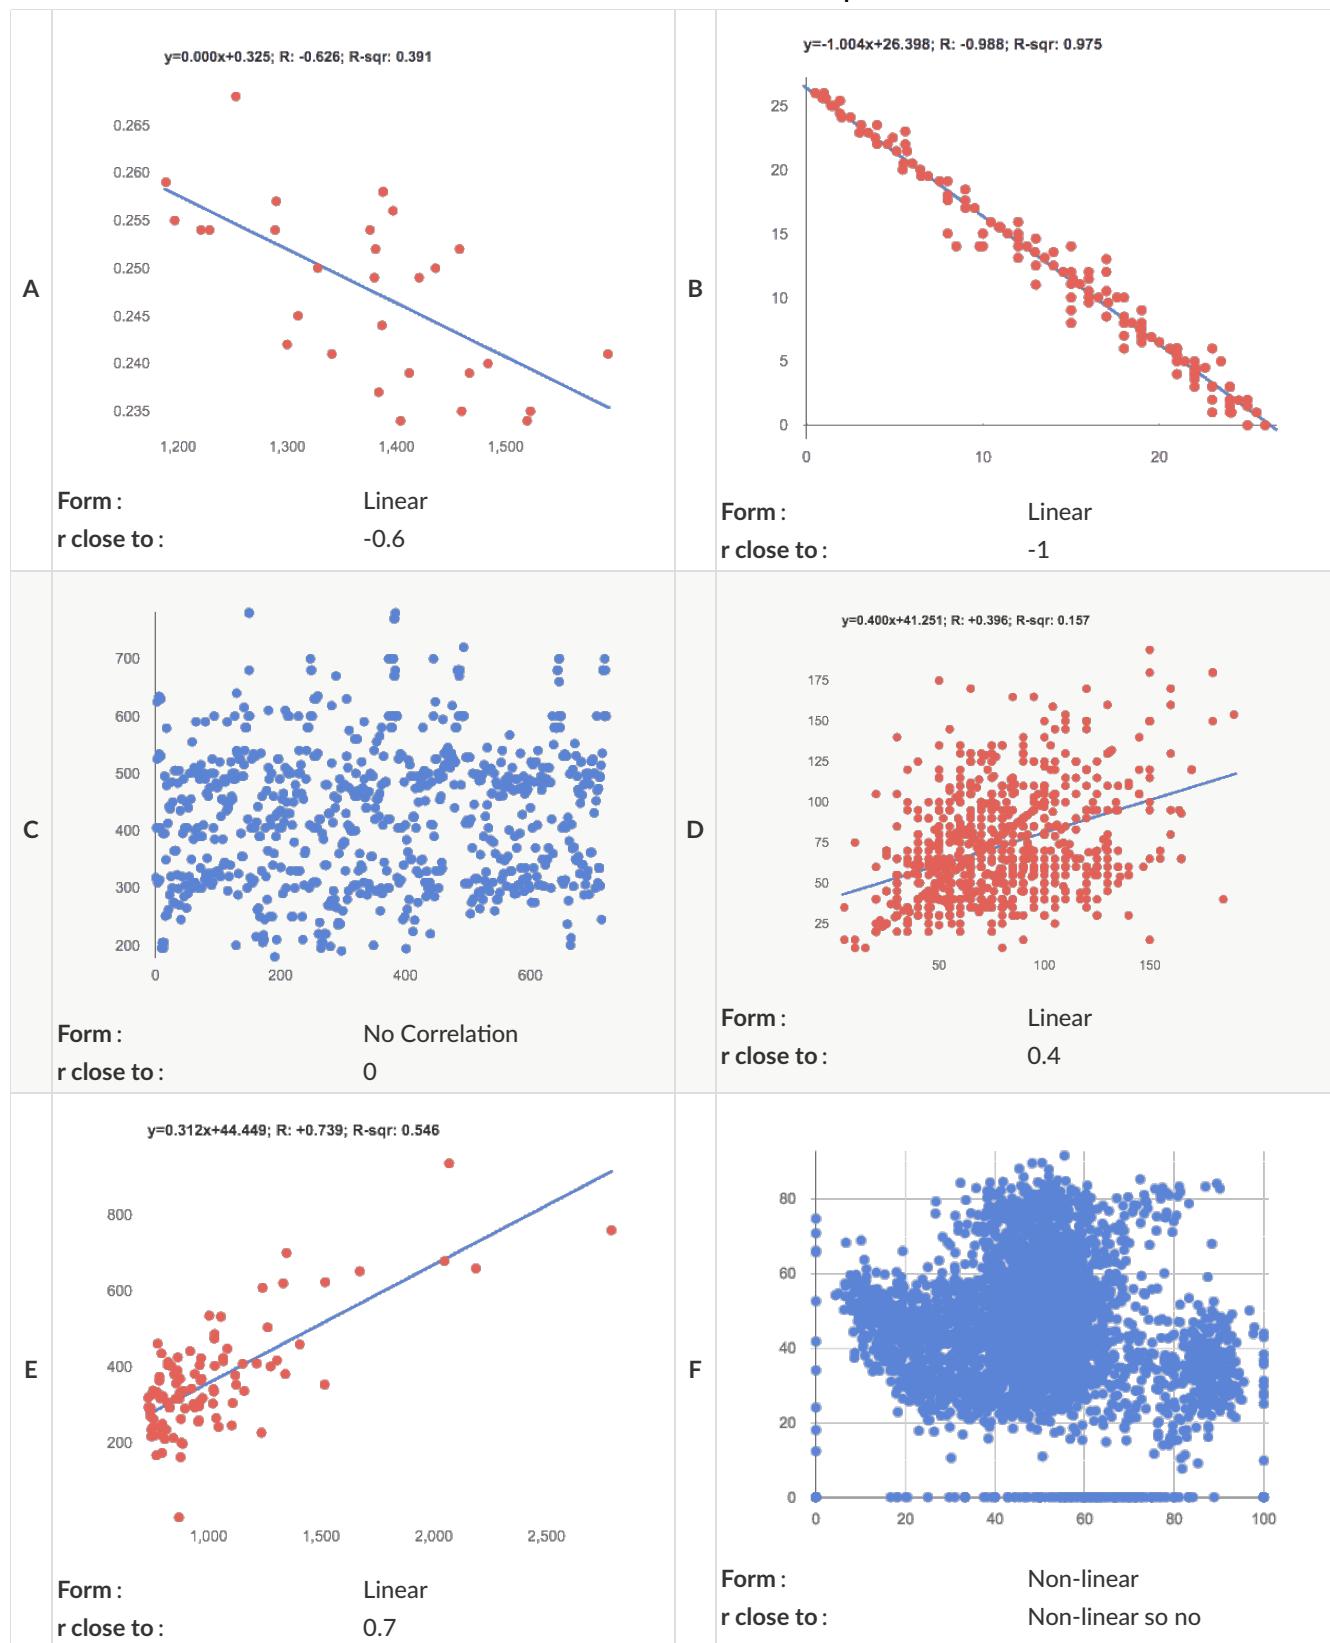

Identifying Form, Direction and Strength

Can you identify the Form, Direction, & Strength of these displays? Note: If the form is non-linear, there is no direction!

Identifying Form and r-Values

Can you identify the Form, Direction, and Strength of these displays? If the form is linear, approximate the r -value to express Direction and Strength. **TEACHERS:** We have run linear regressions on these scatter plots to help you (the educators) to visualize the correlations better. Students have NOT YET been introduced to lr-plots.

Correlations in My Dataset

1) There may be a correlation between _____ and _____.

column

column

I think it is a _____, _____ correlation,
strong/weak positive/negative

because _____.

It might be stronger if I looked at _____.
a sample or extension of my data

2) There may be a correlation between _____ and _____.

column

column

I think it is a _____, _____ correlation,
strong/weak positive/negative

because _____.

It might be stronger if I looked at _____.
a sample or extension of my data

3) There may be a correlation between _____ and _____.

column

column

I think it is a _____, _____ correlation,
strong/weak positive/negative

because _____.

It might be stronger if I looked at _____.
a sample or extension of my data

Computing Relationships

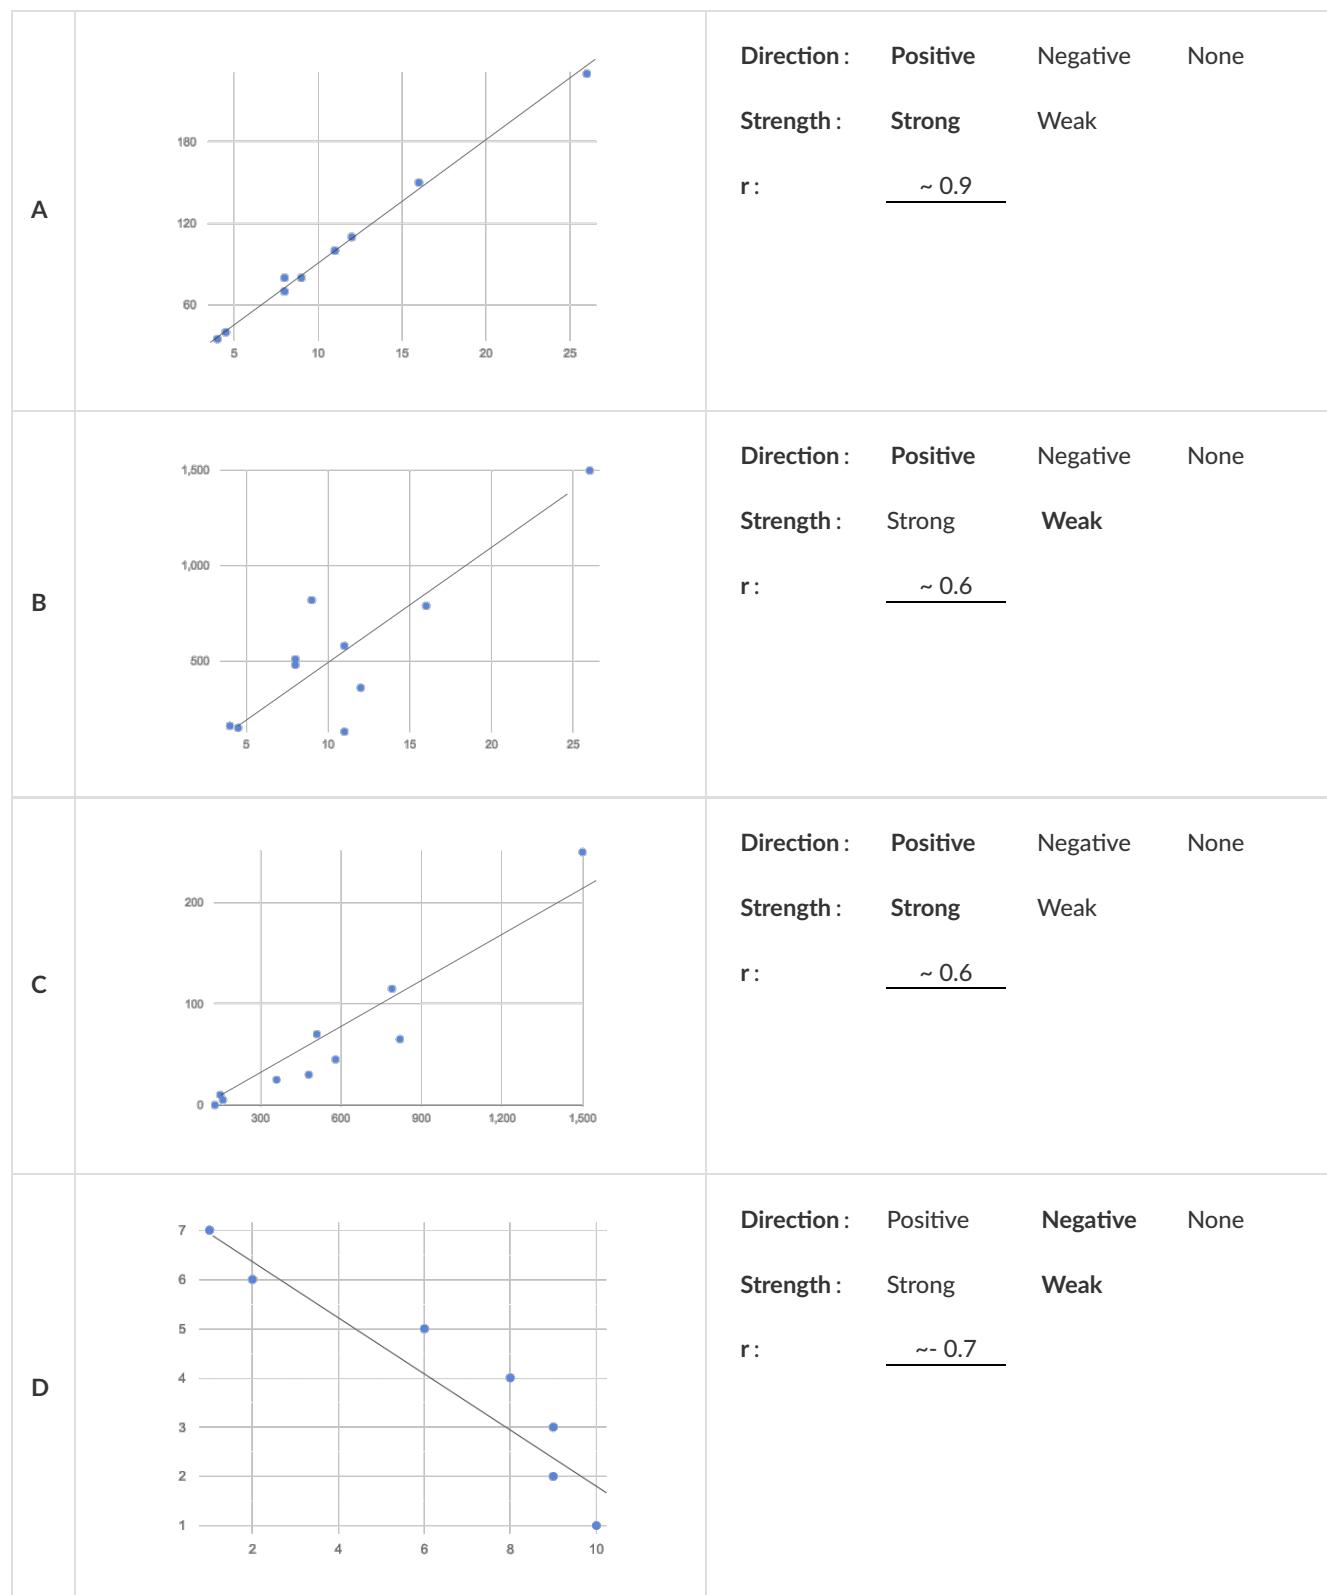

Linear Regression is a way of computing the **line of best fit**, which minimizes the sum of vertical distances of all scatter plot points from the line. Calculating the slope and intercept of this line is a task best left to computing or statistical software.

- **Slope** provides us with the easiest summary to grasp: it's how much we predict the y-variable (response variable) will increase or decrease for each unit that the x-variable (explanatory variable) increases.
- **Correlation is not causation!** Correlation only suggests that two column variables are related, but does not tell us if one causes the other. For example, hot days are correlated with people running their air conditioners, but air conditioners do not cause hot days!
- **Sample size matters!** The number of data values is also relevant. We'd be more convinced of a positive relationship in general between cat age and time to adoption if a correlation of +0.57 were based on 50 cats instead of 5.

Drawing Predictors

For each of the scatter plots below, draw a **predictor line** that seems like the best fit.

Note: Correlation strength is more complex than strong/weak, and depends somewhat on the nature of the dataset! There is some room for debate about the answers below, but students should at least be able to identify that A is stronger than the others.

Interpreting Regression Lines & r-Values

Each description on the left is written about the linear regression findings on the right. Fill in the blanks using the information in the line of best fit and the r-value.

<p>1</p> <p>For every additional Marvel Universe movie released each year, the average person is predicted to consume <u>3.19</u> <u>fewer</u> pounds of sugar! <u>[amount]</u> <u>[more / fewer]</u></p> <p>This correlation is <u>non-existent</u>. <u>[strong, moderate, weak, non-existent]</u></p>	$y = -3.19x + 12$ $r = -0.05$
<p>2</p> <p>Shoe size and height are <u>strongly</u>, <u>positively</u> correlated. If person A is one size bigger than person B, we predict that they will be roughly <u>1.65</u> inches taller than person B as well. <u>[strongly, moderately, weakly, not]</u> <u>[positively / negatively]</u> <u>[amount]</u></p>	$y = 1.65x + 52$ $r = 0.89$
<p>3</p> <p>There is <u>no</u> relationship found between the number of Uber drivers in a city and the number of babies born each year. <u>[a strong, a moderate, no]</u></p>	$y = 0.012x + 7.8$ $r = 0.01$
<p>4</p> <p>The correlation between weeks-of-school-missed and SAT score is <u>moderate</u> and <u>negative</u>. For every week a student misses, we predict a <u>15.3</u> point <u>drop</u> in their SAT score. <u>[strong, moderate, weak, non-existent]</u> <u>[positive / negative]</u> <u>[amount]</u> <u>[gain / drop]</u></p>	$y = -15.3x + 1150$ $r = -0.65$
<p>5</p> <p>There is a <u>weak</u>, <u>positive</u> correlation between the number of streaming video services someone has, and how much they weigh. For each service, we expect them to be roughly <u>1.6</u> pounds heavier. <u>[strong, moderate, weak, non-existent]</u> <u>[positive / negative]</u> <u>[amount]</u></p>	$y = 1.6x + 160$ $r = 0.12$

Regression Analysis in the Animals Dataset

1) I performed a linear regression on a sample of cats from the shelter dataset or subset and found a moderate ($r=0.566$), positive correlation between age of the cats (in years) and number of weeks to adoption. I would predict that a 1 year increase in age in increase is associated with a 0.23 week [slope, y-units].

2) I performed a linear regression on a sample of dataset or subset and found a weak/strong/moderate ($R=...$), positive/negative correlation between [x-axis] and [y-axis]. I would predict that a 1 increase in [x-axis] is associated with a [slope, y-units] [increase/decrease].

3) I performed a linear regression on a sample of dataset or subset and found a weak/strong/moderate ($R=...$), positive/negative correlation between [x-axis] and [y-axis]. I would predict that a 1 increase in [x-axis] is associated with a [slope, y-units] [increase/decrease].

Regression Analysis in Your Dataset

My Dataset is _____.

1) I performed a linear regression on _____ and found
dataset or subset

correlation between

a weak/strong/moderate ($R=...$), positive/negative

and _____.
[x-axis] [y-axis]

I would predict that a 1 _____ increase in _____ is associated with a
[x-axis units] [x-axis]

in _____.
[slope, y-units] [increase/decrease] [y-axis]

2) I performed a linear regression on _____ and found
dataset or subset

correlation between

a weak/strong/moderate ($R=...$), positive/negative

and _____.
[x-axis] [y-axis]

I would predict that a 1 _____ increase in _____ is associated with a
[x-axis units] [x-axis]

in _____.
[slope, y-units] [increase/decrease] [y-axis]

3) I performed a linear regression on _____ and found
dataset or subset

correlation between

a weak/strong/moderate ($R=...$), positive/negative

and _____.
[x-axis] [y-axis]

I would predict that a 1 _____ increase in _____ is associated with a
[x-axis units] [x-axis]

in _____.
[slope, y-units] [increase/decrease] [y-axis]

What's on your mind?

Case Study: Ethics, Privacy, and Bias

My Case Study is _____

- 1) Read the case study you or your group was assigned, and write your summary here.

- 2) Is this a good thing or a bad thing? Why?

- 3) What are the arguments on *each* side?

Data Science used for this purpose is good because...

Data Science used for this purpose is bad because...

Threats to Validity

Threats to Validity can undermine a conclusion, even if the analysis was done correctly.

Some examples of threats are:

- **Selection bias** - identifying the favorite food of the rabbits won't tell us anything reliable about what all the animals eat.
- **Study bias** - If someone is supposed to assess how much cat food is eaten each day on average, but they only measure how much cat food is put in the bowls (instead of how much is actually consumed), they'll end up with an over-estimate.
- **Poor choice of summary** - Suppose a different shelter that had 10 animals recorded adoption times (in weeks) as 1, 1, 1, 7, 7, 8, 8, 9, 9, 10. Using the mode (1) to report what's typical would make it seem like the animals were adopted much quicker than they really were, since 7 out of 10 animals took at least 7 weeks to be adopted.
- **Confounding variables** - Shelter workers might steer people towards newer animals, because they've become attached to the animals that have been there for a while, making it appear that "staying in the shelter longer" means "less likely to be adopted".

Identifying Threats to Validity

Some volunteers from the animal shelter surveyed a group of pet owners at a local dog park. They found that almost all of the owners were there with their dogs, and from this survey, they concluded that dogs are the most popular pet in the state.

What are some possible threats to the validity of this conclusion?

Sample bias: most people at a dog park are going to be dog owners!

And a single park may also be biased towards people who live near that park - we can't make generalizations about a whole state!

The animal shelter noticed a large increase in pet adoptions between Christmas and Valentine's Day. They conclude that at the current rate, there will be a huge demand for pets this spring.

What are some possible threats to the validity of this conclusion?

Confounding variable: lots of people give puppies and kittens as gifts for these holidays.

Identifying Threats to Validity

The animal shelter wanted to find out what kind of food to buy for their animals. They took a random sample of two animals and the food they eat, and they found that spider and rabbit food was by far the most popular cuisine!

What are some possible threats to the validity of this conclusion?

Two animals is *not* large enough to be a representative sample!

It's too easy to randomly choose animals that give us unreliable conclusions.

The sample size is too small to be representative.

A volunteer opens the shelter in the morning and walks all the dogs. At mid-day, another volunteer feeds all the dogs and walks them again. In the evening, a third volunteer walks the dogs a final time and closes the shelter. The volunteers report that the dogs are much friendlier and more active at mid-day, so the shelter staff assume the second volunteer must be better with animals than the others.

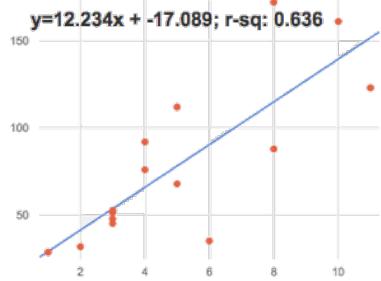

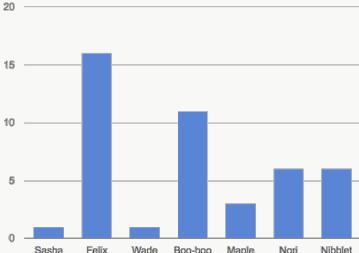

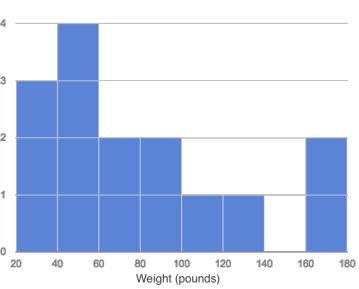

What are some possible threats to the validity of this conclusion?

There may be several confounding variables here. Perhaps the volunteer is carrying bacon in their pocket!

Or perhaps dogs are in better moods in the middle of the day, when the sun is out

Fake News!

Every claim below is wrong! Your job is to figure out why by looking at the data.

	Data	Claim	What's Wrong
1	The average player on a basketball team is 6'1".	"Most of the players are taller than 6'."	Average (mean) is highly sensitive to outliers. Most players could be under 6', with one 6'10" player throwing off the mean.
2	Linear regression found a positive correlation ($r=0.18$) between people's height and salary.	"Taller people get paid more."	Correlation is not causation, and - more importantly - an R-value of 0.18 is very weak and should not be trusted.
3		"According to the predictor function indicated here, the value on the x-axis will predict the value on the y-axis 63.6% of the time."	R-Values tell us how much of the variability in the dataset is explained by the predictor, not how accurate it is!
4		"According to this bar chart, Felix makes up a little more than 15% of the total ages of all the animals in the dataset."	Felix is 15 years old.
5		"According to this histogram, most animals weigh between 40 and 60 pounds."	Incorrect. The 40-60 pound bin has more animals than any other bin, but it makes up only a small fraction of the whole.
6	Linear regression found a negative correlation ($r= -0.91$) between the number of hairs on a person's head and their likelihood of owning a wig.	"Owning wigs causes people to go bald."	Correlation is not causation!

Lies, Darned Lies, and Statistics

1) Using real data and displays from your dataset, come up with a misleading claim.

2) Trade papers with someone and figure out why their claims are wrong!

Data	Claim	Why it's wrong

What's on your mind?

Design Recipe

Directions :

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name domain range

what does the function do?

Examples

Write some examples, then circle and label what changes...

examples:

_____ (_____) is _____
function name input(s) what the function produces

_____ (_____) is _____
function name input(s) what the function produces

end

Definition

Write the definition, giving variable names to all your input values...

fun _____ (_____):
function name variable(s)

what the function does with those variable(s)

end

Directions :

Contract and Purpose Statement

Every contract has three parts...

_____ :: _____ -> _____
function name domain range

what does the function do?

Examples

Write some examples, then circle and label what changes...

what the function does with those variable(s)

end

Contracts

Contracts tell us how to use a function. For example: num-min :: (a :: Number, b :: Number) -> Number tells us that the name of the function is num-min , it takes two inputs (both Numbers), and it evaluates to a Number . From the contract, we know num-min(4, 6) will evaluate to a Number . Use the blank line under each contract for notes or sample code for that function!

Name	Domain	Range
triangle	:: (side-length :: Number, style :: String, color :: String)	-> Image
triangle(80, "solid", "darkgreen")		
circle	:: (radius :: Number, style :: String, color :: String)	-> Image
circle(30, "outline", "fuchsia")		
star	:: (radius :: Number, style :: String, color :: String)	-> Image
star(50, "solid", "teal")		
rectangle	:: (width :: Num, height :: Num, style :: Str, color :: Str)	-> Image
rectangle(20, 80, "solid", "gold")		
ellipse	:: (width :: Num, height :: Num, style :: Str, color :: Str)	-> Image
ellipse(30, 70, "outline", "lightblue")		
square	:: (size-length :: Number, style :: String, color :: String)	-> Image
square(10, "outline", "red")		
text	:: (str :: String, size :: Number, color :: String)	-> Image
text("I'm thankful for..., 50, "green")		
overlay	:: (img1 :: Image, img2 :: Image)	-> Image
overlay(star(30, "solid", "gold"), circle(30, "solid", "blue"))		
beside	:: (img1 :: Image, img2 :: Image)	-> Image
beside(star(50, "solid", "orange"), circle(50, "solid", "green"))		
above	:: (img1 :: Image, img2 :: Image)	-> Image
above(star(30, "solid", "red"), square(30, "solid", "blue"))		
put-image	:: (img1 :: Image, x :: Number, y :: Number, img2 :: Image)	-> Image
put-image(star(30, "solid", "red"), 50, 150, rectangle(300, 200, "outline", "black"))		
rotate	:: (degree :: Number, img :: Image)	-> Image
rotate(35, rectangle(30, 80, "solid", "purple"))		
scale	:: (factor :: Number, img :: Image)	-> Image
scale(0.8, triangle(30, "solid", "red"))		

Contracts

Contracts tell us how to use a function. For example: num-min :: (a :: Number, b :: Number) -> Number tells us that the name of the function is num-min , it takes two inputs (both Numbers), and it evaluates to a Number . From the contract, we know num-min(4, 6) will evaluate to a Number . Use the blank line under each contract for notes or sample code for that function!

Name	Domain	Range
string-repeat	:: (text :: String, repeat :: Number)	-> String
string-contains	:: (text :: String, search-for :: String)	-> Boolean
string-contains("rockstar", "star")		
num-sqr	:: (n :: Number)	-> Number
num-sqr(9)		
num-sqrt	:: (n :: Number)	-> Number
num-sqrt(25)		
num-min	:: (a :: Number, b:: Number)	-> Number
num-min(80, 20)		
num-max	:: (a :: Number, b:: Number)	-> Number
num-max(80, 20)		
count	:: (t :: Table, col :: String)	-> Table
count(animals-table, "species")		
mean	:: (t :: Table, col :: String)	-> Number
mean(animals-table, "age")		
median	:: (t :: Table, col :: String)	-> Number
median(animals-table, "age")		
modes	:: (t :: Table, col :: String)	-> List<Number>
modes(animals-table, "age")		
bar-chart	:: (t :: Table, col :: String)	-> Image
bar-chart(animals-table, "legs")		
pie-chart	:: (t :: Table, col :: String)	-> Image
pie-chart(animals-table, "species")		
histogram	:: (t :: Table, values :: String, bin-width :: Number)	-> Image
histogram(animals-table, "age", 2)		

Contracts

Contracts tell us how to use a function. For example: num-min :: (a :: Number, b :: Number) -> Number tells us that the name of the function is num-min , it takes two inputs (both Numbers), and it evaluates to a Number . From the contract, we know num-min(4, 6) will evaluate to a Number . Use the blank line under each contract for notes or sample code for that function!

Name	Domain	Range
box-plot	:: (t :: Table, col :: String)	-> Image
box-plot(animals-table, "age")		
modified-box-plot	:: (t :: Table, col :: String)	-> Image
modified-box-plot(animals-table, "age")		
scatter-plot	:: (t :: Table, labels :: String, xs :: String, ys :: String)	-> Image
scatter-plot(animals-table, "species", "pounds", "weeks")		
image-scatter-plot	:: (t :: Table, xs :: String, ys :: String, f :: (Row -> Image))	-> Image
image-scatter-plot(animals-table, "pounds", "weeks", animal-img)		
r-value	:: (t :: Table, xs :: String, ys :: String)	-> Number
r-value(animals-table, "pounds", "weeks")		
lr-plot	:: (t :: Table, labels :: String, xs :: String, ys :: String)	-> Image
lr-plot(animals-table, "species", "pounds", "weeks")		
random-rows	:: (t :: Table, num-rows :: Number)	-> Table
random-rows(animals-table, 5)		
<Table>.row-n	:: (n :: Number)	-> Row
animals-table.row-n(5)		
<Table>.order-by	:: (col :: String, increasing :: Boolean)	-> Table
animals-table.order-by("species", true)		
<Table>.filter	:: (test :: (Row -> Boolean))	-> Table
animal-table.filter(is-cat)		
<Table>.build-column	:: (col :: String, builder :: (Row -> Any))	-> Table
animals-table.build-column("sticker", label)		
bar-chart-summarized	:: (t :: Table, labels :: String, values :: String)	-> Image
bar-chart-summarized(animals-table, "species", "pounds")		
pie-chart-summarized	:: (t :: Table, labels :: String, values :: String)	-> Image
pie-chart-summarized(animals-table, "age", "pounds")
